

SP918B Wireless Xbox Solution

Online Gaming Application

Micronet's advanced technology and standard based Wireless LAN (WLAN) products enable online gaming application possible. Works without driver on any gaming devices such as Xbox. There are still more as long as it has an Ethernet Port, SP918B can even apply to Linux and network printers, anything you need with, is just an Ethernet Port.

Enter the SP918B, Micronet's Wireless to Ethernet converter.

Look! no wires! Well, at least not in the living room.

The SP918B is a new device from Micronet meant to replace a physical wire running from your Xbox to your hub or switch. Essentially it takes the Ethernet signals that the Xbox puts out and converts them into a wireless signal. The signal then travels to your central Wireless Access Point, is converted back to a regular Ethernet, and you can play normally. Or so they'd like you to believe.
