Aeolian Vibration of Damped Single Conductors

1. Fundamentals
2. Waves, Dampers & Damping Efficiency
3. How the Technology Works
4. What to Do

Prandtl & Tietjens 1934

2

1. Fundamentals

$$f = St \cdot \frac{V}{D} \quad (St \approx 0.2) \quad f \text{ (Hz)} = 3.26 \cdot \frac{V \text{ (mph)}}{D \text{ (inches)}}$$

V = 2 to 15 mph

Drake $f \approx 6$ to 44 Hz

Fujarra et al (1998) 3

Koopman 1967

4

Koopman 1967

5

Fundamentals

6

Fundamentals

$$P_w - P_c - P_D = 0$$

7

Fundamentals

Pick a wind velocity e. g. 10 mph.

Pick a conductor, e. g. Drake

$$f = 3.26 \cdot \frac{10 \text{ mph}}{1.108 \text{ inches}} = 29.4 \text{ Hz}$$

8

Fundamentals

Power balance components

V = 10 mph

9

Fundamentals

Vibration loops

$$\lambda = \frac{1}{f} \cdot \sqrt{H/m}$$

Drake @ 25% RS

$\lambda \approx 11 \text{ to } 80 \text{ feet}$

10

Fundamentals

Self damping

$$\lambda = \frac{1}{f} \cdot \sqrt{H/m}$$

11

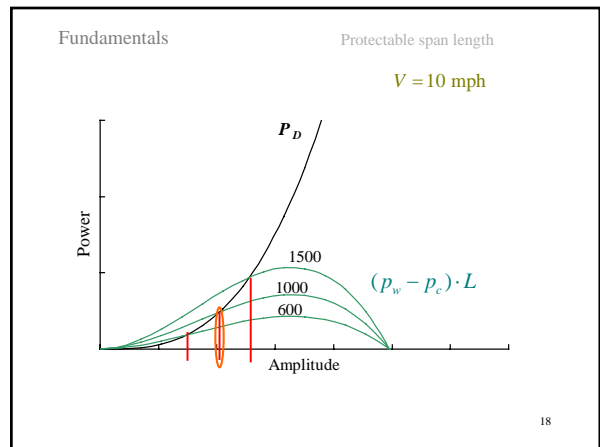

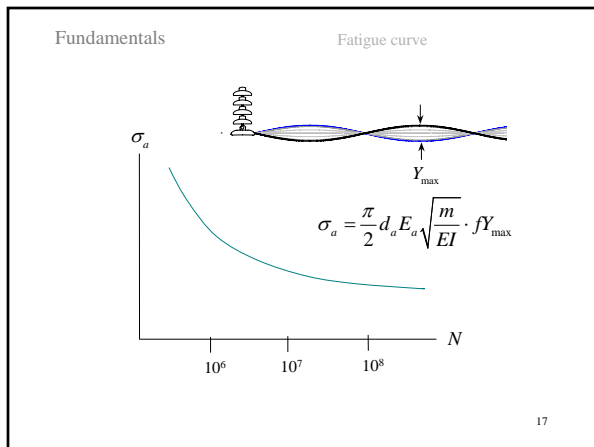

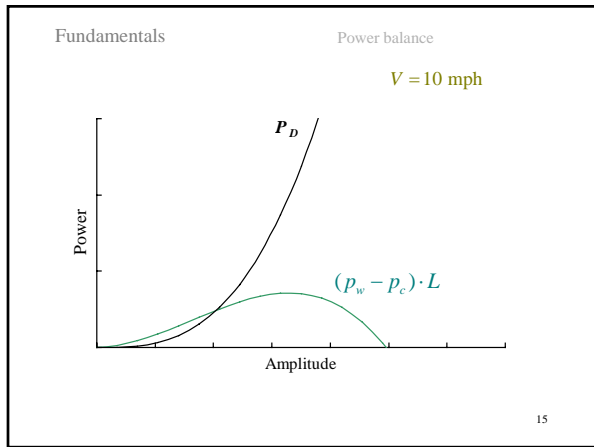

Fundamentals

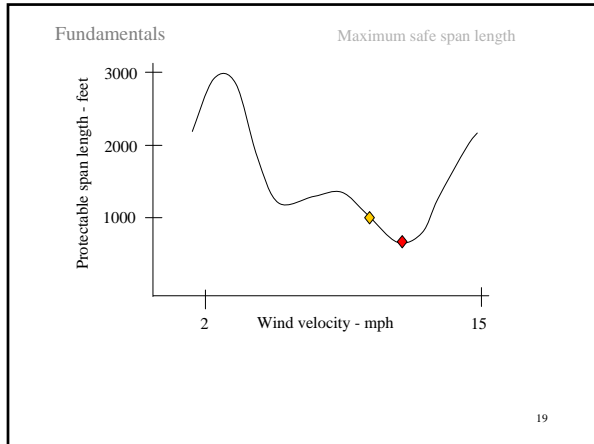

Power balance components

V = 10 mph

12

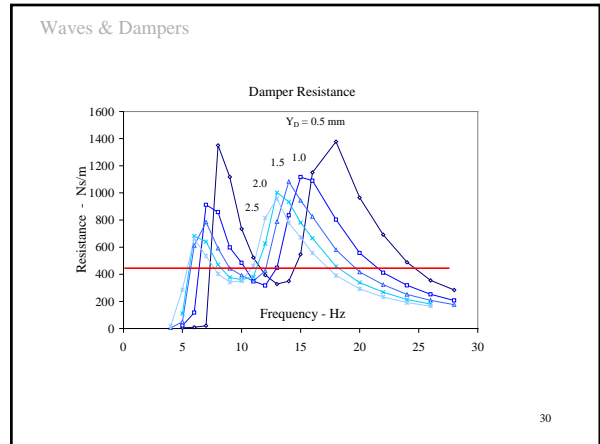

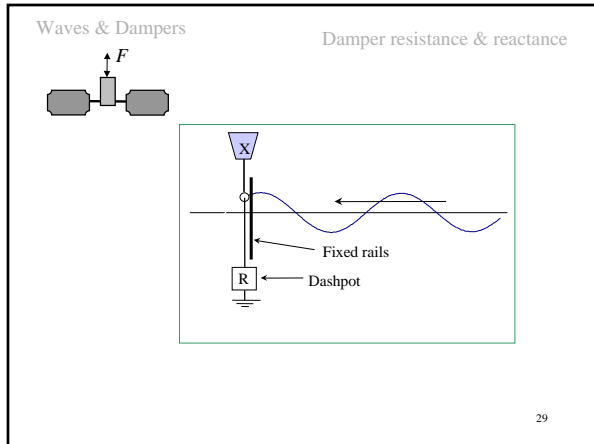

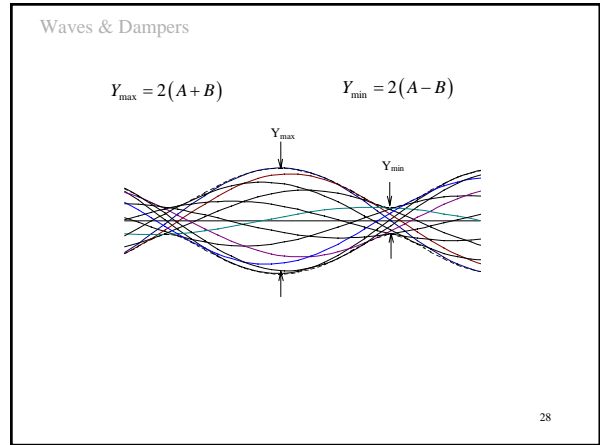

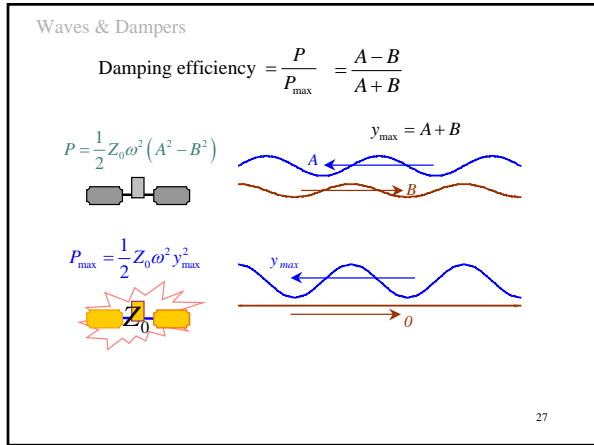

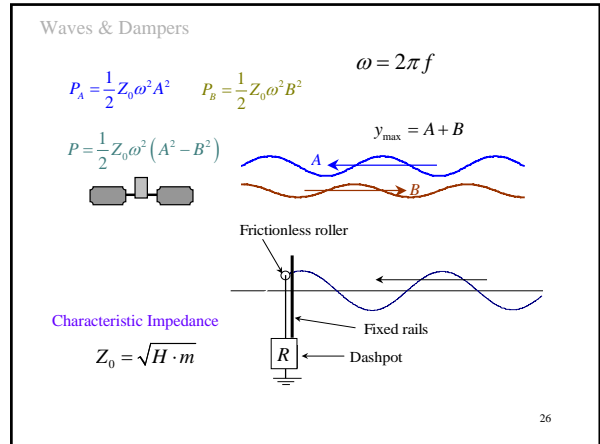

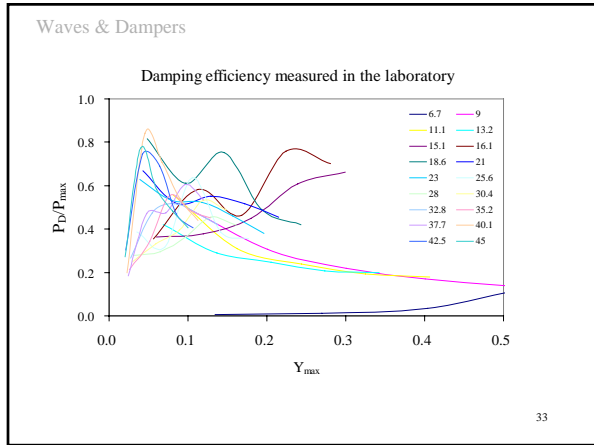

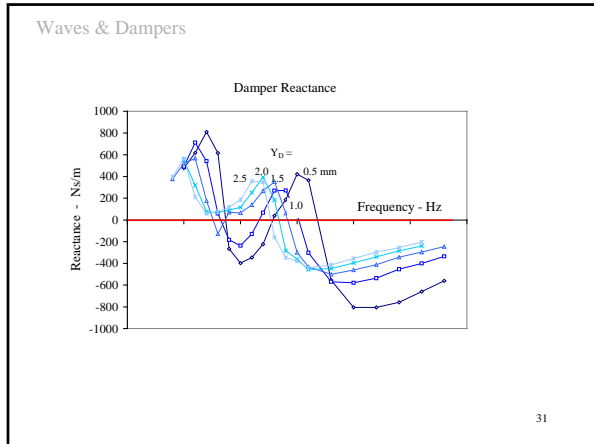

2. Waves, Dampers & Damping Efficiency

20

Waves & Dampers

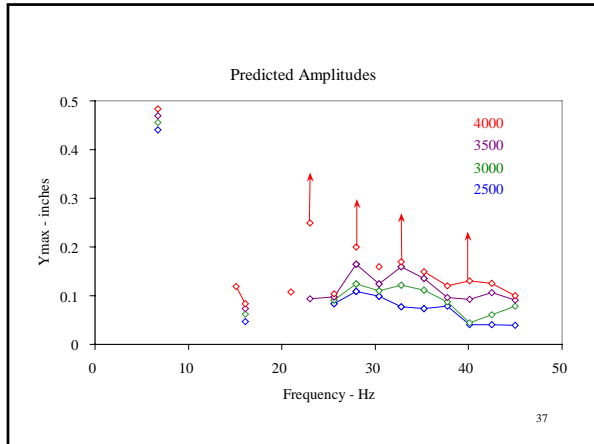

$$P_D = P_w - P_c$$

$$\frac{P_D}{P_{\max}} = \frac{P_w}{P_{\max}} - \frac{P_c}{P_{\max}}$$

$$P_{\max} = \frac{1}{2} Z_0 \omega^2 y_{\max}^2$$

65

The Course

IREQ Varennes Test Line near Montreal

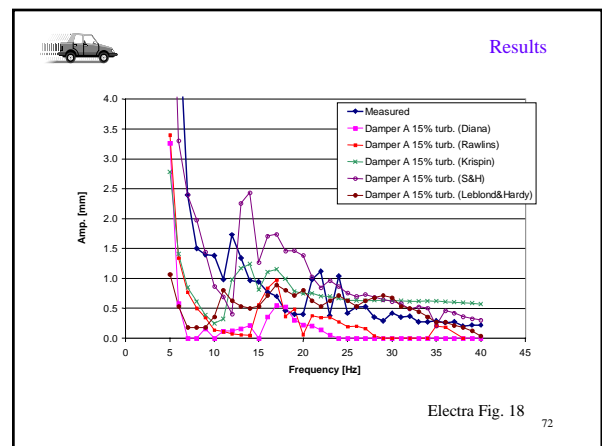

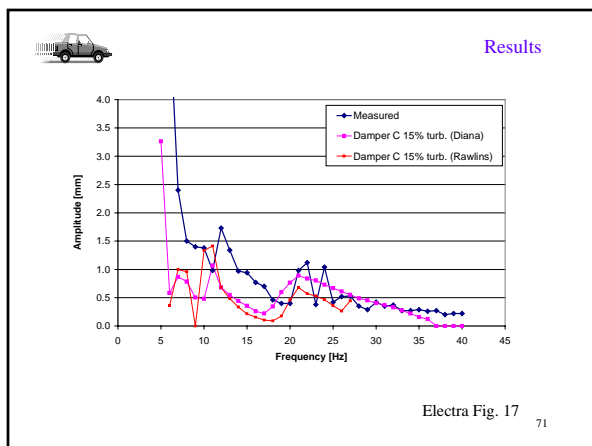

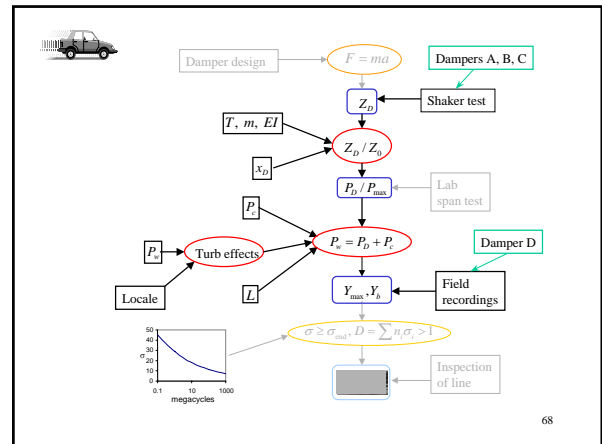

Conductor	Type	ACSR Bersfort (48/7)
	Diameter	35.6 mm
	Mass per unit length	2.37 kg/m
Span length	Tension	36 kN
	450 m (suspension)	
Type of terrain	open, flat, no obstruction, with snow cover (farmland)	
Position of the damper	one damper/span located 1.7 m from centre of the suspension clamp	

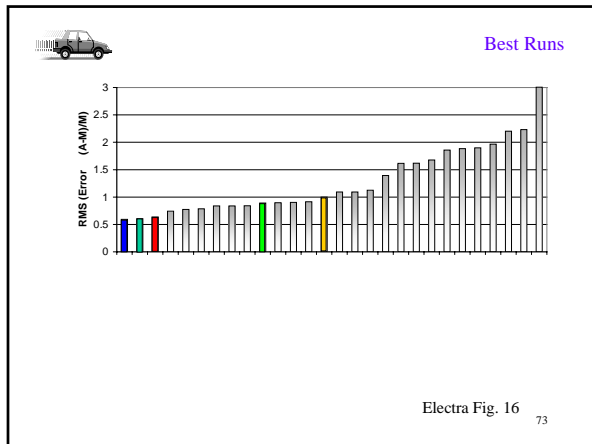

66

 **The Drivers**

Diana et al (University of Milan)
 H-J Krispin (RIBE)
 Leblond & Hardy (IREQ)
 Rawlins (Alcoa Fujikura)
 Sauter & Hagedorn (University of Darmstadt)

67

Differences between teams:

1. Wind power functions.
2. Self damping models.
3. Secondary effects, e.g. stiffness.
4. Modeling damper/conductor in different ways.

74

Differences between teams:

1. Wind power functions.

Differences with field data:

1. All of the above.
2. Modeling damper/conductor interaction.

75

Benchmark Results

- The different teams differed widely in their predictions of vibration amplitudes.
- Some differences were due to different data bases on wind power and self-damping.
- None of the predictions agreed well with field measurements.
- This is mainly due to problems in the modeling of the interaction of the damper with the conductor.

76

Conclusion

This branch of the technology is not accurate enough to use in specifying vibration protection.

77

DEAM System

Accelerometers

$$P = \frac{1}{2} Z_0 \omega^2 (A^2 - B^2)$$

Leblond & Hardy

78

79

Conclusion

This branch may be accurate enough to use in specifying vibration protection..

80

1. Why did I spend all this time presenting the technology, when I knew it wasn't very useful to the designer?

2. OK, if that isn't useful, what is?

81

4. What to Do?

2. OK, if that isn't useful, what is?

82

Resources:

1. Your own experience. If it worked before (or didn't), it will do the same again.
2. Experience of others. If it worked for them...

83

84

$$\frac{P_w}{P_{max}} = St \cdot \frac{V}{\sqrt{H/m}} \cdot \frac{\rho LD}{m} \cdot \delta_r$$

$$\frac{P_w}{P_{max}} = St \cdot V \cdot \rho \cdot \frac{LD}{\sqrt{H \cdot m}} \cdot \delta_r$$

$$K = \frac{D}{\sqrt{RS \cdot w}}$$

$$T_{\%} = 100 \cdot \frac{H}{RS}$$

Damper Suppliers!

WHAT??

91

Why????!

All suppliers have some system for making recommendations.

They have the most comprehensive knowledge of their system's performance.

They are well motivated to avoid repetition of any unsatisfactory performance.

They are in the best position to maintain the system to achieve that.

92

Protection recommendations will not agree.

1. Suppliers have different technical approaches.

2. Their damper designs are different.

3. Their exposures to field experience have differed.

1. Why did I spend all that time presenting the technology, when I knew it wasn't very useful?

93

The End
