

POSTSCRIPT FOR TECHNICAL DRAWINGS PSPLOT: A FORTRAN-CALLABLE POSTSCRIPT PLOTTING LIBRARY

USER'S MANUAL

Kevin E. Kohler

Nova Southeastern University Oceanographic Center 8000 North Ocean Drive Dania, Florida 33004

1. INTRODUCTION

This manual is intended for users interested in generating two-dimensional technical drawings or graphics for technical journals in PostScript format. The manual describes a library of Fortran-callable subroutines which can be combined in a calling program to produce PostScript plot files. The purpose, syntax, and calling convention of each subroutine is presented , along with plotting examples.

PostScript is a very robust graphics and typesetting language with wide-ranging capabilities. Since the focus of the subroutines in this library is to produce technical drawings, many of the "artistic" features of PostScript have not been addressed or included here.

The name PostScript is a registered trademark of Adobe Systems Incorporated. All instances of the name PostScript in this manual are references to the PostScript language as defined by Adobe Systems Incorporated.

Send questions, comments, suggestions to kevin@ocean.nova.edu.

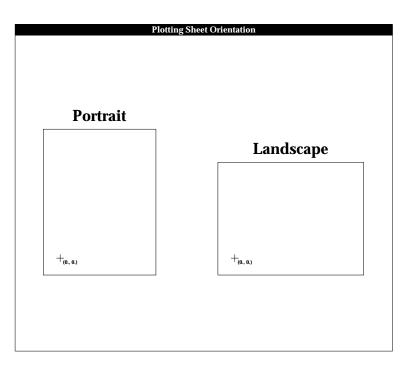

2. PLOTTING BASICS

This section will present the conventions used by the plotting subroutines in the PSPLOT plotting library . This information can be used to create customized plotting subroutines.

A *plotting session* is a set of plotting instructions in a user's application program which produces hardcopy graphic display output. The output can be either a single plot or graph or a set of graphs. Every plotting session must begin with a call to subroutine PSINIT (with the exception of a call to NEWDEV) and end with a call to subroutine PLOTND.

Pen movement is occasionally mentioned throughout this manual. While PostScript does not use an actual pen for graphic production, it is useful to visualize the plot commands as directing the movements of a pen of variable thickness to a specified (x,y) coordinate, with the pen being either up or down. The plotting subroutines are simple, user-callable commands which direct the movements of an imagined pen upon a plotting sheet.

The initial coordinate origin is approximately .5 inches from the bottom and left paper edges. The orientation of the page must be specified to be either **portrait** (short side horizontal) or **landscape** (long side horizontal) and is set by the call to PSINIT (which see). The figure below shows the paper orientation and beginning plot origin for portrait and landscape modes. The current plot origin can be relocated to other positions during the plotting session to provide new reference points for subsequent plotting commands. When the next graph is started, the new origin should be placed far enough away to avoid overlapping the just-completed graph.

All plotting commands use an *absolute* plot coordinate system. This means that all coordinates passed to plotting subroutines are expected to be in terms of distance from the current plot origin. This is contrast to a *relative* plot coordinate system, in which coordinates are assumed to be in terms of distance from the current pen position.

In all plotting subroutines, plot coordinates, character heights, distances, etc. are measured in *inches*.

Unless otherwise noted, any subroutine argument which specifies an angle is stated in *degrees relative to the X axis, with positive angles measured counterclockwise from the X axis.*

Most character variables are specified as Hollerith, rather than character strings. The reason for this is primarily historical, combined with the fact that the enormous amount of code already written and in use at my site precluded a comprehensive revision. This should not cause any problems, however.

The initial font of a plot session is Helvetica, with a size of 12 points. This can be changed permanently in subroutine PSINIT. Of course, the current font can always be changed with subroutine SETFNT. PSPLOT supports the standard 35 fonts found on most PostScript printers.

PSPLOT supports color, although all examples in this manual are shown in grayscale for the purposes of reproduction. Color is specified in the relevant subroutines as red, green, and blue (RGB) values.

Continuation allows you to append a character string or number to the end of a previously plotted string or number. The coordinates of the appended string are automatically calculated. Whether or not a subroutine supports continuation is stated in subroutine description in the next section.

Continuation is specified by setting the X and/or Y coordinate argument in calls to the subroutines listed above to 999, and may be applied to X and Y coordinates separately. A subroutine call with continuation must immediately follow the previous plotting call. Continuation is useful when plotting strings containing variable values, such that the resultant string length is not known beforehand.

For example,

ND=10 CALL KEKNUM (1., 2., .15, FLOAT(ND), 0., -1, 0) CALL KEKSYM (999., 999., .15, 5H DAYS, 0. ,5, 0)

produces "10 DAYS".

3. USER-LEVEL PLOTTING ROUTINES

This section describes the subroutines in the PSPLOT plotting library at the time of this writing. These routines are Fortran-callable from an application program. Below is a brief summary of the subroutines, followed by an alphabetical listing of each subroutine containing a more detailed description of its function, syntax, and calling arguments.

ARC	Draws an arc of a specified radius and center.
AROHED	Draws an arrowhead at a specified location.
ARROW	Draws an arrow including the shaft.
AXIS	Draws an axis of a graph, with user-specified axis titles.
BLKSTP	Strips out embedded blanks in a character string.
BORDER	Draws a rectangular border with tick marks.
CHOPIT	Logically closes the current page and begins a new one.
CIRCLE	Draws a circle with specified center, radius and fill.
CLIP	Inserts the PostScript command <i>clip</i> into the output file.
CLIPBOX	Defines the current clipping area.
COLBOX	Fills regions with specified color.
CONCOLR	Draws colored contour plots of a 2-dimensional array of regularly-spaced data.
CONFILL	Draws grayscale contour plots of a 2-dimensional array of regularly-spaced data.
CONREC	Draws contour plots of a 2-dimensional array of regularly- spaced data.
CURVE	Draws a curve between 2 points with specified beginning and ending slopes.
DRWCRV	Connects data points with a solid line.
DRWTRI	Draws a triangle.

- **DSHCRV** Connects data points with a dashed curve.
- **DSHLIN** Draws a dashed line between two points.
- **FACTOR** Enlarges or reduces a plot by a specified ratio.
- **FAROHED** Draws a "fancy" arrowhead.
- **FILLBOX** Fills a shape with a specified grayscale level.
- **FILRGN** Same as FILLBOX, except it restores the current gray level after filling.
- **FILRGNC** Fills a shape with the current gray level or color.
- **GREST** Calls the PostScript operator grestore.
- **GRKSYM** Plots a Greek symbol.
- **GSAV** Calls the PostScript operator *gsave*.
- **HILITEC** Prints text surrounded by a rectangular box (color).
- **HILITEG** Prints text surrounded by a rectangular box (grayscale).
- **INTEGRAL** Plots an integral with upper and lower limits.
- **KEKEXP** Plots a floating point number in exponential format.
- **KEKFLT** Plots a floating point number in floating point format.
- **KEKNUM** Plots a floating point number.
- **KEKSYM** Plots a character string.
- **KEKSYMC** Plots a character string, with the text string being character rather than Hollerith.
- **KEKSYMO** Plots a character string with the characters outlined instead of filled.
- **LENSTR** Computes the number of characters in a character string.
- **NEWDEV** Specifies the name of the output PostScript file.
- **NUMBER** Plots a floating point number. Similar to KEKNUM, but justification and continuation are not supported.

- **ONEHLF** Draws the symbol ½.
- **OVERBAR** Draws a character string with an overbar.
- **OVRSBSP** Draws an overbar over a subscripted and superscripted character string.
- **OVRSBSPG** Draws an overbar over a subscripted and superscripted Greek symbol.
- **OVERSUB** Draws an overbar over a subscripted character string.
- **OVERSUBG** Draws an overbar over a subscripted Greek symbol.
- **OVERSUP** Draws an overbar over a superscripted character string.
- **OVERSUPG** Draws an overbar over a superscripted Greek symbol.
- **OVRGRK** Draws an overbar over a Greek symbol.
- **PLOT** Directs "pen" movement to a specified (x,y) point with the "pen" either up or down.
- **PLOTND** Closes the output PostScript file and terminates the plotting session.
- **PLSMIN** Draws the ± character.
- **PRIME** Draws the ' character.
- **PSINIT** Called to begin a plotting session. It also specifies portrait or landscape mode.
- **RECT** Draws a rectangle.
- **RECTFILC** Draws a rectangle and fills it with specified red, green, and blue color levels.
- **RECTFILG** Draws a rectangle and fills it with specified gray level.
- **ROTATE** Rotates the current coordinate system by a specified angle. Essentially, ROTATE issues the PostScript *rotate* command.
- **RRECT** Draws a rectangle with rounded corners. It can then fill the rectangle with the current graylevel or RGB values.
- **SETCOLR** Sets the current color values.

- **SETFNT** Sets the current font.
- **SETGRY** Sets the current gray level value.
- **SETLW** Sets the current line width.
- **SIGMA** Draws the symbol Σ , with upper and lower limits.
- **SLDCRV** Connects data points with a solid curve.
- **SLDLIN** Draws a solid line between two points.
- **SQRSGN** Draws the radical (square root) sign.
- **SQUARE** Draws a square.
- **STROKE** Calls the PostScript operator *stroke*.
- **SUBBER** Draws a subscript.
- **SUBBERSP** Draws a subscript of "special" characters.
- **SUBSUP** Draws a subscript and superscript.
- **SUBSUPSP** Draws subscripts and superscripts of "special" characters.
- **SUPER** Draws a superscript.
- **SUPERSP** Draws a superscript of "special" characters.
- **SYMBOL** Plots a character string. Similar to KEKSYM, but justification and continuation are not supported.

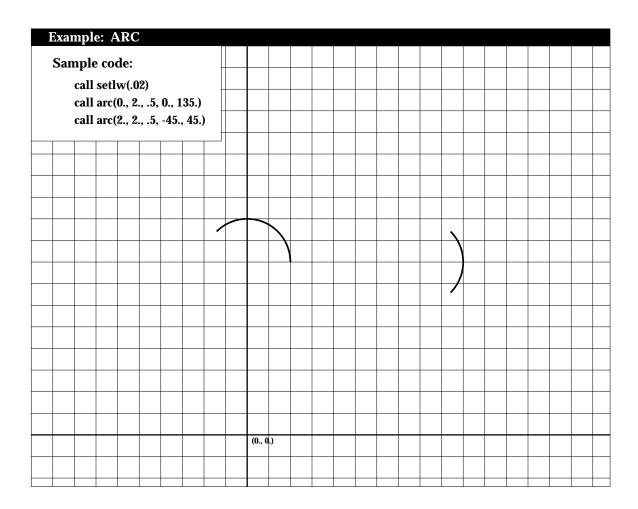

The plotting subroutines in the PSPLOT plotting library are written in Fortran and are called by user-written application programs. In the following subroutine descriptions, integer variables are denoted by arguments beginning with the letters I-N, as per Fortran convention. All other variables are real (4 byte) floating point Fortran and are called by user-written application programs. All of the subroutines are written in single precision. Hence, if your program generates data in double precision, any arguments sent to the plotting library subroutines must first be converted to single precision.

ARC

PURPOSE **ARC** draws an arc having a specified radius and arc center.

SYNTAX CALL ARC (XC, YC, RAD, ANG1, ANG2)

- XC, YC X,Y coordinates of the center of the arc.
- RAD Radius of arc.
- ANG1 Angle of arc beginning.
- ANG2 Angle of arc ending.

AROHED

PURPOSE **AROHED** draws an arrowhead at a specified location.

SYNTAX CALL AROHED (XPP, YPP, DIR, AROLNP, SPRANG, LOCXY)

- XPP,YPP X,Y coordinates of the tip of the arrowhead.
- DIR Direction of arrowhead, measured east from north.
- AROLNP Length of arrowhead sides.
- SPRANG Half the angular spread of arrowhead.
- LOCXY Location of arrowhead point LOCXY=1 XPP,YPP at arrowhead point (most commonly used) LOCXY=2 XPP, YPP at center of arrowhead. LOCXY=3 XPP,YPP at tail of arrowhead.

ARROW

PURPOSE **ARROW** draws an arrow, with vector length, at a specified location.

SYNTAX CALL ARROW (XSS, YSS, XPP, YPP, AROLNP, SPRANG, LOCXY)

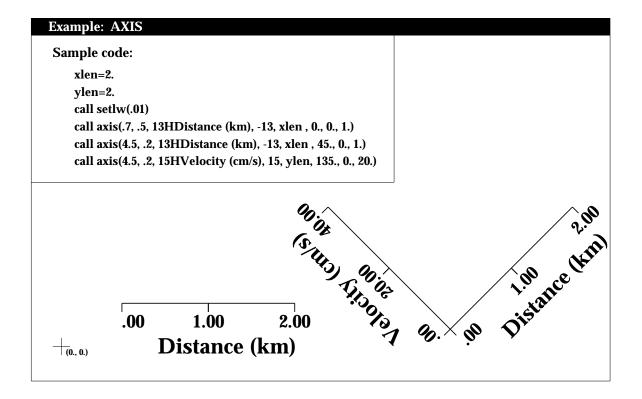

- XSS,YSS X,Y coordinates of the vector length origin.
- XPP,YPP X,Y coordinates of the tip of the arrowhead.
- AROLNP Length of arrowhead sides.
- SPRANG Half the angular spread of arrowhead.
- LOCXY Location of arrowhead point LOCXY=1 XPP,YPP at arrowhead point (most commonly used) LOCXY=2 XPP, YPP at center of arrowhead. LOCXY=3 XPP,YPP at tail of arrowhead.

												1								
											\vdash						 		 	
									(0., ().)							 			

AXIS

- *PURPOSE* **AXIS** draws an axis of a graph, with user-specified axis titles. Tick marks are drawn with a spacing of one inch.
- SYNTAX CALL AXIS (XPP, YPP, IBCD, NC, AXLEN, THETA, RMIN, DEL)

- XPP,YPP X,Y coordinates of axis origin.
- IBCD Axis title (Hollerith).
- NC Number of characters in title. Its sign is used to specify on which side of the axis the title is to appear: positive for the counterclockwise side of the axis, negative for the clockwise side. Positive labeling is generally used for Y axes, negative for X axes.
- AXLEN Length of axis.
- THETA Angle of axis. Generally, 0 for X axes, 90 for Y axes.
- RMIN The starting value and annotation of the first tick mark.
- DEL The data value increment between tick marks.

BLKSTP

- *PURPOSE* **BLKSTP** strips out embedded blanks in a character string. It returns the new character string and the number of characters in the new string.
- SYNTAX CALL BLKSTP (STR1, NDIM, STR2, NC)

- STR1 Input character string.
- NDIM Maximum length of STR1 as stated in calling program.
- STR2 Output character string with embedded blanks removed.
- NC Number of characters in STR2.

BORDER

- *PURPOSE* **BORDER** draws a rectangular border with tick marks. The lower left corner of the border is located at the current plot origin.
- SYNTAX CALL BORDER (XLEN, YLEN, ITIC, IBRD, MAJX, MINX, MAJY, MINY)

<u>ARGUMENTS</u>

- XLEN Length of x-direction side of border.
- YLEN Length of y-direction side of border.
- ITIC Four digit number which determines which of the border sides will contain tick marks. Each of the digits is either 0 or 1, and if set to 1, that side will contain tick marks. The border sides are ordered as follows:

Left-vertical Bottom Right-vertical Top

For example, if ITIC = 1011, all sides except the bottom would contain tick marks. Additionally, if ITIC<0, the tick marks will be drawn on the outside of the border than on the inside (default).

- IBRD IBRD is similar to ITIC except that it determines which sides of the border will be drawn. Hence, you can have tick marks with no border, and vice versa.
- MAJX Number of major divisions in the x-direction. A longer tick mark is drawn for these divisions.
- MINX Number of minor divisions in the x-direction, i.e. the number of divisions per major division. A shorter tick mark is drawn for these divisions.
- MAJY Same as MAJX in y-direction.
- MINY Same as MINX in y-direction.

Example: BORDER		
Sample code: call setlw(.01) call border(1.5, 1.5, 1111, 1111, 4, 2, 3, 4) call plot(2., 0., -3) call border(1., 1.7, -1010, 1001, 4, 1, 5, 3)		

CHOPIT

PURPOSE **CHOPIT** logically closes the current graphics page and begins a new one.

SYNTAX CALL CHOPIT (XPP, YPP)

ARGUMENTS

XPP,YPP X,Y coordinates of the initial plot origin of the next plot. This allows you to begin all plots at the same origin on each page.

Note: XPP and YPP are coordinates independent of the current scaling factor. That is, XPP and YPP represent actual inches, not scaled coordinates. The current scaling factor is reinstated after the new coordinate origin is set.

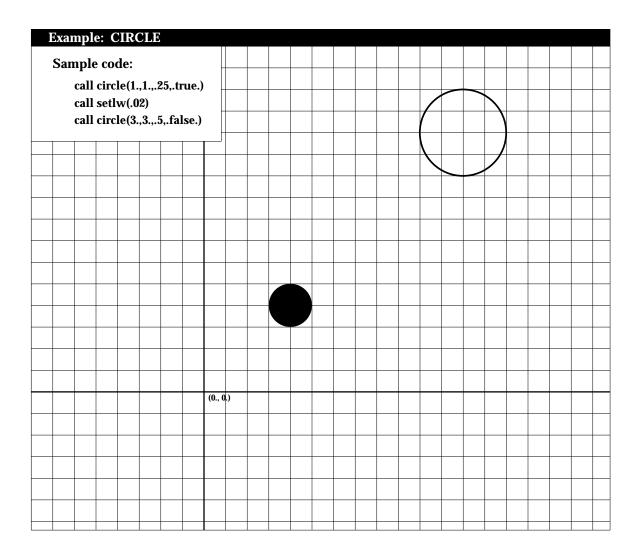

Subroutine CHOPIT should not be confused with subroutine PLOTND, which is called once at the end of each plotting session and which closes the entire output PostScript file.

CIRCLE

PURPOSE **CIRCLE** draws a circle.

SYNTAX CALL CIRCLE (XC, YC, RAD, FILL)

- XC,YC X,Y coordinates of the center of the circle.
- RAD Radius of the circle.
- FILL Logical value. If FILL=.TRUE., circle is filled with the current color or gray scale; otherwise it is outlined.

CLIP

PURPOSE **CLIP** inserts the PostScript command *clip* into the output file.

SYNTAX CALL CLIP

<u>ARGUMENTS</u>

NONE.

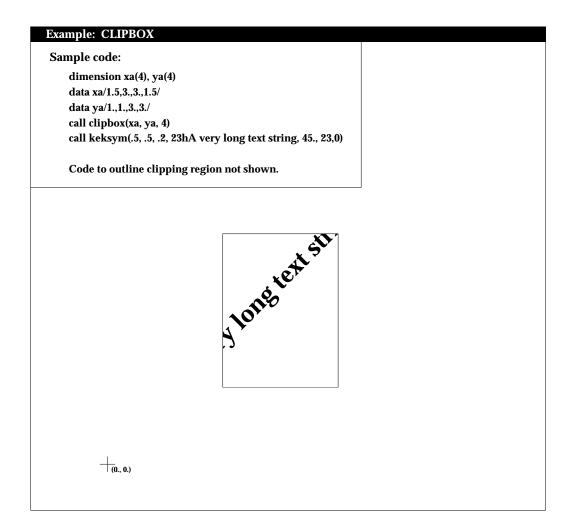

Note: Most uses of this command are bracketed by calls to GSAV and GREST.

CLIPBOX

PURPOSE CLIPBOX defines a clipping region.

SYNTAX CALL CLIPBOX (XPTS, YPTS, NPTS)

- XPTS Array containing x-coordinates of region path.
- YPTS Array containing y-coordinates of region path.
- NPTS Number of points in region path.

COLBOX

PURPOSE **COLBOX** fills a region with a specified color.

SYNTAX CALL COLBOX (XPTS, YPTS, NPTS, RED, GREEN, BLUE)

ARGUMENTS

XPTS	Array containing x-coordinates of region path.
YPTS	Array containing y-coordinates of region path.
NPTS	Number of points in region path.
RED	Red value of specified color in RGB color model.
GREEN	Green value of specified color in RGB color model.
BLUE	Blue value of specified color in RGB color model.

Arguments RED, GREEN, and BLUE must lie between 0. and 1.0, inclusive.

CONCOLR

PURPOSE **CONCOLR** draws color contour plots of a two-dimensional array of regularly spaced data.

SYNTAX CALL CONCOLR (ARR, IMAX, IEXT, JEXT, XLEN, YLEN, CVAL, COLOR, NVAL, IOFFP, SPVAL)

ARGUMENTS

ARR	Two-dimensional array containing regularly spaced data to be contoured. CONCOLR assumes ARR(1,1) is located at the lower left corner of the plot. Data points ARR(1,1) through ARR(IEXT,JEXT) are contoured in an area XLEN x YLEN.
IMAX	The first dimension of ARR in the calling program.
IEXT	Number of points in x-direction of ARR to be contoured.
JEXT	Number of points in y-direction of ARR to be contoured.
XLEN	X-direction length of plotting area.
YLEN	Y-direction length of plotting area.
CVAL	Array containing the values to be used for contour intervals (1 to NVAL). CVAL must be dimensioned with a dimension of at least 1. Unlike in subroutine CONREC, NVAL cannot equal 0.
COLOR	Array dimensioned (3,NVAL) containing the red, green, and blue values for each of the contour levels. The red value is stored in (1,n), the green value in (2,n) and the blue value in (3,n), where n specifies the contour index corresponding to CVAL. Regions less than or equal to the corresponding contour value CVAL are filled with the corresponding RBG values.
NVAL	Number of contour intervals. NVAL must be less than or equal to 100, and unlike in CONREC, NVAL cannot equal 0.
IOFFP	Flag indicating that grid boxes whose vertices have the value SPVAL are to be ignored during contouring.
SPVAL	Special value denoting which grid boxes are to be ignored during contouring.

See coding example for CONFILL.

CONFILL

- *PURPOSE* **CONFILL** draws grayscale contour plots of a two-dimensional array of regularly spaced data.
- SYNTAX CALL CONFILL(ARR, IMAX, IEXT, JEXT, XLEN, YLEN, CVAL, GRYLEV, NVAL, IOFFP, SPVAL)

ARR	Two-dimensional array containing regularly spaced data to be contoured. CONFILL assumes ARR(1,1) is located at the lower left corner of the plot. Data points ARR(1,1) through ARR(IEXT,JEXT) are contoured in an area XLEN x YLEN.
IMAX	The first dimension of ARR in the calling program.
IEXT	Number of points in x-direction of ARR to be contoured.
JEXT	Number of points in y-direction of ARR to be contoured.
XLEN	X-direction length of plotting area.
YLEN	Y-direction length of plotting area.
CVAL	Array containing the values to be used for contour intervals (1 to NVAL). CVAL must be dimensioned with a dimension of at least 1. Unlike subroutine CONREC, NVAL cannot equal 0.
GRYLEV	Array dimensioned (NVAL) containing the grayscale values for each of the contour levels. Regions less than or equal to the corresponding contour value CVAL are filled with the corresponding grayscale values. Grayscale values range from 0. (black) to 1.0 (white).
NVAL	Number of contour intervals. NVAL must be less than or equal to 100, and unlike in CONREC, NVAL cannot equal 0.
IOFFP	Flag indicating that grid boxes whose vertices have the value SPVAL are to be ignored during contouring.
SPVAL	Special value denoting which grid boxes are to be ignored during contouring.

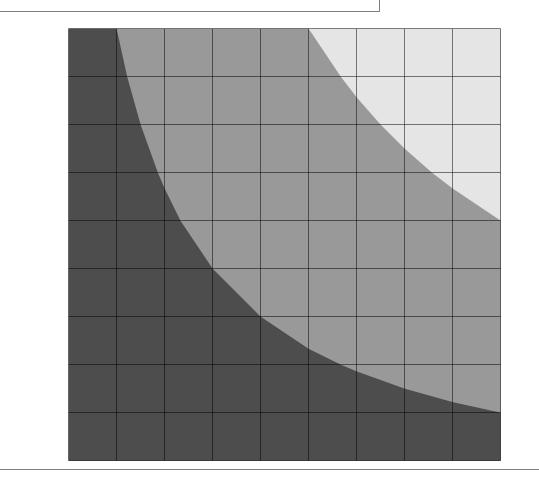

Example: CONFILL

Sample code:

do 10 j=1,10 do 10 i=1,10 10 f(i,j)=i*j xlen=5. ylen=5. nval=6 do 20 n=1,nval cval(n)=(n-1)*20 if(cval(n).le.20.) then grylev(n)=.3 elseif(cval(n).le.60.) then grylev(n)=.6 else grylev(n)=.9 endif continue

20 call confill(f,10,10,10,xlen,ylen,cval,grylev,nval,ioffp,spval)

Code to draw grid boxes not shown.

CONREC

- *PURPOSE* **CONREC** draws contour plots of a two-dimensional array of regularly spaced data.
- SYNTAX CALL CONREC (ARR, IMAX, IEXT, JEXT, XLEN, YLEN, CVAL, NVAL)

ARGUMENTS

ARR Two-dimensional array containing regularly spaced data to be contoured. CONREC assumes ARR(1,1) is located at the lower left corner of the plot. Data points ARR(1,1) through ARR(IEXT, JEXT) are contoured in an area XLEN x YLEN. IMAX The first dimension of ARR in the calling program. IEXT Number of points in x-direction of ARR to be contoured. JEXT Number of points in y-direction of ARR to be contoured. **XLEN** X-direction length of plotting area. YLEN Y-direction length of plotting area. **CVAL** Array containing the values to be used for contour intervals (1 to NVAL). CVAL must be dimensioned with a dimension of at least 1. If NVAL = 0, the individual contour values are automatically computed. **NVAL** Number of contour intervals. If NVAL = 0, the number of contour intervals and the contour interval values are automatically calculated. This is helpful if the range of data values is not known beforehand. NVAL must be less than or equal to 100.

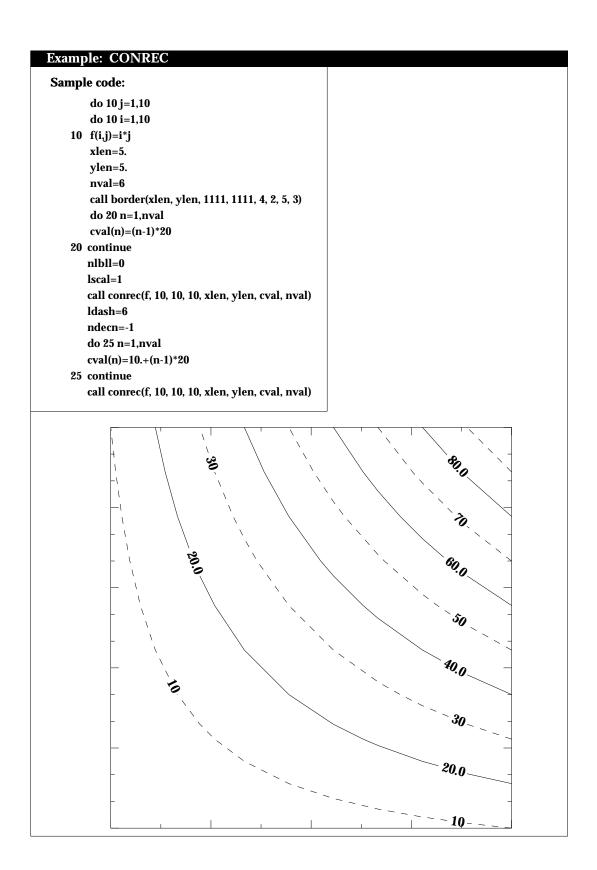

Special features of CONREC:

If NVAL < 0, only high and lows are plotted instead of contours.

Common block CONPAR is used to control various characteristics of the contour plot from the calling program. The variables in CONPAR are shown below, along with their default values:

COMMON	J/CONPAR/	ISPEC, IOFFP, SPVAL, ILEGG, ILABB, NHII, NDECCN, NLBLL, LSCAL, LDASH, HGTLAB
ISPEC	If 0, variables i	in CONPAR have no effect. Default = 0 .

IOFFP If 1, you can specify regions not to contour by using SPVAL. Grid boxes with any corner values equal to SPVAL are not contoured. Default = 0.**SPVAL** Special value to denote areas not to contour (usually set to 999.). Default = 0. ILEGG If 0, legend below contour plot showing contour values, scale factors, etc. will not be printed. Default = 1. ILABB If 0, contour labels are not plotted. Default = 1. NHII If 0, H and L mark relative highs and lows, with the data value plotted underneath the symbol. If > 0, values are plotted at each array point. If < 0. neither of the above is done. Default = 0.Number of digits to the right of the decimal point in the contour NDECCN labels. Default = 1. Number of unlabeled contours between labelled contours. Default = NLBLL 3. **LSCAL** If LSCAL = 0, the contours are scaled such that 0 < labeled values <100. If LSCAL = 1, the contours are not scaled, i.e. the contour values are the actual data values. Default = 0. LDASH Specifies whether contours are solid (LDASH = 0) or dashed (LDASHNE 0). If LDASH is not equal to 0, then LDASH specifies the type of dash line to use to draw the contours. The numeric value of LDASH is the number of times the dashed pattern (solid line/blank space) is repeated per inch. Default= 0. HGTLAB Specifies the height of contour labels. If HGTLAB=0, the height of the contours is .11 inches.

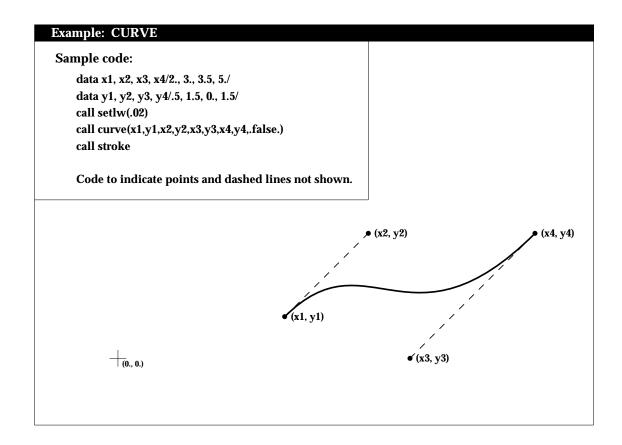

CURVE

- *PURPOSE* **CURVE** draws a curve between two points, given the beginning and ending curve slopes.
- SYNTAX CALL CURVE (X1, Y1, X2, Y2, X3, Y3, X4, Y4, CONTIN)

ARGUMENTS

X1,Y1	X,Y coordinates of the beginning of the curve.
X2,Y2	X, Y coordinates specifying the beginning curve slope. The initial slope of the curve is given by $(Y2-Y1)/(X2-X1)$.
X3,Y3	X,Y coordinates specifying the ending curve slope. The end slope of the curve is given by $(Y4-Y3)/(X4-X3)$.
X4,Y4	X,Y coordinates of the endpoint of the curve.
CONTIN	Logical value. If CONTIN=.false. then the curve drawn starts a newpath; otherwise, the curve is appended to the current path.

Note: The curve produced by CURVE is not automatically stroked.

DRWCRV

PURPOSE DRWCRV draws a solid curve.

SYNTAX CALL DRWCRV (XARR, YARR, NPTS, THK, CLOSER)

- XARR Array containing the x-coordinates of the points to be connected.
- YARR Array containing the y-coordinates of the points to be connected.
- NPTS Number of points in the curve.
- THK Thickness of the curve. If THK = 0., the current linewidth is used.
- CLOSER Logical variable. If CLOSER = .TRUE., the last point in the data arrays is connected to the first point, i.e. the curve is closed; otherwise, the curve is open.

Example: DRWCRV				
Sample code:				
dimension xp1(6), yp	(6)			
dimension xp2(3), yp				
data xp1/ .5, 1., 1.5, 2.,				
data yp1/ 0., 1., .5, 1.7	, 1.5, .5 /			
data xp2/ 4., 4.5, 5. /				
data yp2/ .5, 1.5, 1. /				
call drwcrv(xp1, yp1, call drwcrv(xp2, yp2,				
can urwerv(xp2, yp2,	, .03, .uue.)			
Code to draw axes no	shown.			
		\rightarrow		
		$- \cdot \cdot $		
(0., 0.)				

DRWTRI

PURPOSE **DRWTRI** draws an equilateral triangle.

SYNTAX CALL DRWTRI (XC, YC, SIDE, THK)

- XC, YC X, Y coordinates of triangle **center**.
- SIDE Length of triangle side.
- THK Thickness of line used to draw the triangle. If THK = 0., the current line width is used.

Example: DRWTRI			
Sample code:			
xc=2.			
yc=2.			
tlen=1.			
call drwtri(xc, yc, tlen, .	02)		
			\mathbf{N}
		P	
	(0., 0.)		

DSHCRV

- *PURPOSE* **DSHCRV** connects points in two data arrays using a line with a specified dash pattern.
- SYNTAX CALL DSHCRV (XARR, YARR, NPTS, IDSHPN, THK)

- XARR Array containing the x-coordinates of the points to be connected.
- YARR Array containing the y-coordinates of the points to be connected.
- NPTS Number of points in the curve.
- IDSHPN Dashed pattern of the line used to connect the data points. IDSHPN is specified as the number of times the dashed pattern (solid line/blank space) is repeated per inch.
- THK Thickness of the dashes in the curve. If THK = 0., the current line width is used.

DSHLIN

PURPOSE **DSHLIN** connects two points using a line with a specified dash pattern.

SYNTAX CALL DSHLIN (X1, Y1, X2, Y2, IDSHPN, THK)

X1,Y1	X,Y coordinates of first data point.
X2,Y2	X,Y coordinates of second data point.
IDSHPN	Dashed pattern of the line used to connect the two data points. IDSHPN is specified as the number of times the dashed pattern (solid line/blank space) is repeated per inch.
THK	Thickness of the dashes in the connecting line. If $THK = 0$., the current line width is used.

Example: DSHLIN											
Sample code:				 						 	
call dshlin(1., 1., 2., 2., 6, .02)

FACTOR

PURPOSE **FACTOR** enlarges or reduces the size of a plot by a specified ratio.

SYNTAX CALL FACTOR (FACT)

ARGUMENTS

FACT The ratio of the desired plot size to the actual size. FACT must be a positive floating point number.

For example, to enlarge a plot to twice its normal size:

CALL FACTOR (2.0)

FAROHED

PURPOSE **FAROHED** draws a "fancy" arrowhead at a specified location.

SYNTAX CALL FAROHED (XPP, YPP, DIR, AROLNP, SPRANG, LOCXY, FILL)

- XPP, YPP X, Y coordinates of the tip of the arrowhead.
- DIR Direction of arrowhead, measured east from north.
- AROLNP Length of arrowhead sides.
- SPRANG Half the angular spread of arrowhead.
- LOCXY Location of arrowhead point LOCXY=1 XPP,YPP at arrowhead point (most commonly used) LOCXY=2 XPP, YPP at center of arrowhead. LOCXY=3 XPP,YPP at tail of arrowhead.
- FILL Logical variable. If FILL= .TRUE., the arrowhead is filled; otherwise it is outlined.

FILLBOX

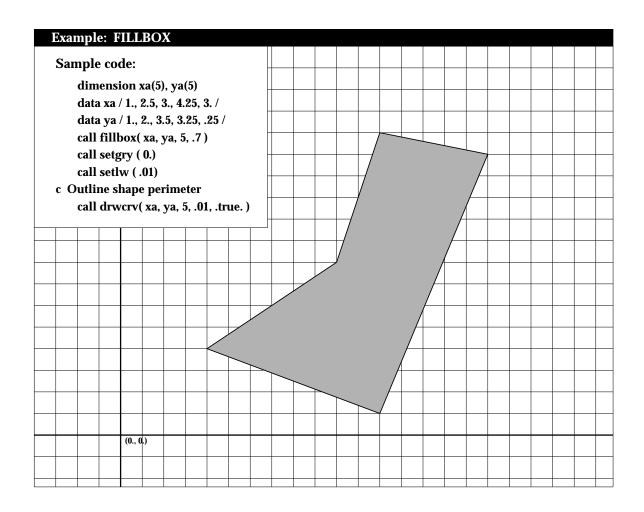

PURPOSE **FILLBOX** fills a shape with a specified gray level.

SYNTAX CALL FILLBOX (XARR, YARR, NPTS, GRY)

ARGUMENTS

XARR	Array containing the x-coordinates of the points forming the perimeter of the shape to fill.
YARR	Array containing the y-coordinates of the points forming the perimeter of the shape to fill.
NPTS	Number of points comprising the shape perimeter.
GRY	Gray level of filled shape. GRY must lie between 0. (black) and 1. (white), inclusive.

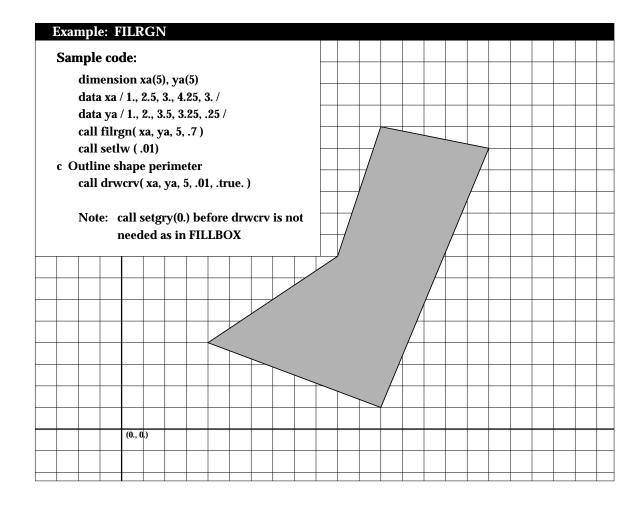

Note: The current gray level remains at value GRY after exiting FILLBOX.

FILRGN

- *PURPOSE* **FILRGN** is the same as FILLBOX, except it restores the current gray level after filling.
- SYNTAX CALL FILRGN (XARR, YARR, NPTS, GRY)

- XARR Array containing the X coordinates of the points forming the perimeter of the shape to fill.
- YARR Array containing the Y coordinates of the points forming the perimeter of the shape to fill.
- NPTS Number of points comprising the shape perimeter.
- GRY Gray level of filled shape. GRY must lie between 0.(black) and 1. (white), inclusive.

FILRGNC

PURPOSE **FILRGNC** fills a region with the current gray level or color.

SYNTAX CALL FILRGNC (XARR, YARR, NPTS)

- XARR Array containing the X coordinates of the points forming the perimeter of the shape to fill.
- YARR Array containing the Y coordinates of the points forming the perimeter of the shape to fill.
- NPTS Number of points comprising the shape perimeter.

GREST

PURPOSE **GREST** calls the PostScript operator *grestore*. It is useful after establishing and using a clipping region when it is no longer needed.

SYNTAX CALL GREST

ARGUMENTS

NONE

GREST is used to restore the graphics state of a PostScript page. It is called after a clipping region has been established and is no longer needed. GREST is used in conjunction with GSAV.

GRKSYM

PURPOSE GRKSYM plots a Greek symbol.

SYNTAX CALL GRKSYM (XPP, YPP, HEIGHT, ICH, ANG, NCHAR, MJUS)

ARGUMENTS

- XPP,YPP X,Y coordinates of the Greek symbol to be plotted. Plotting may be continued from the end of a previously plotted character when used in conjunction with any of the subroutines which support continuation.
- HEIGHT Height of Greek symbol to be plotted.
- ICH Integer value between 1 and 50 corresponding to the desired Greek symbol (see table below).
- ANG Angle, measured counterclockwise from the X-axis, at which the character is to be plotted.
- NCHAR Number of characters to be plotted (should be set to 1).
- MJUS Controls the justification of the character to be plotted.

If MJUS = 0, (XPP, YPP) denotes the position of the lower left corner of the plotted character.

If MJUS = 1, (XPP,YPP) denotes the position of the center of the plotted character.

If MJUS = 2, (XPP,YPP) denotes the position of the lower right corner of the plotted character.

PostScript Greek Symbols ΑΒΓΔΕΖΗΘΙΚΛΜΝΞΟΠΡ Y. 9 10 11 13 14 15 16 12 17 18 19 20 γδε ζηθικλμν $\Phi X \Psi \Omega \alpha$ β π 0 32 33 34 35 36 37 25 26 27 28 29 30 31 χψωθ τυφ 0 ρσ 47 43 44 45

GSAV

PURPOSE **GSAV** calls the PostScript operator *gsave*. It is useful before establishing and using a clipping region.

SYNTAX CALL GSAV

ARGUMENTS

NONE

GSAV is used to save the graphics state of the PostScript page prior to defining a clipping region. After the clipping region is used, GREST is called to restore the original graphics state.

HILITEC

PURPOSE **HILITEC** prints text surrounded by a rectangular box (color).

SYNTAX CALL HILITEC (XPP, YPP, HEIGHT, CSTR, ANG, EDG, JUSX, JUSY, FRED, FGREEN, FBLUE, BRED, BGREEN, BBLUE)

ARGUMENTS

XPP,YPP	X,Y coordinates	s of the box surrounding the text.
HEIGHT	Height of text t	o be plotted.
CSTR	Character string	g text to be plotted.
ANG	Angle, measure is to be plotted.	ed counterclockwise from the X-axis, at which the text
EDG	Fraction of the	text height to use as an edge border.
JUSX	Justification in JUSX=0 is left j JUSX=1 is cente JUSX=2 is right	ustification. ered.
JUSY	Similar to JUSX JUSY=0 is botto JUSY=1 is cente JUSY=2 is top ju	ered.
FRED, FGI	REEN, FBLUE	Foreground text RGB values. Must lie between 0. and 1.0, inclusive.
BRED, BG	REEN, BBLUE	Background box RGB values. Must lie between 0. and 1.0, inclusive.

See code example for HILITEG.

HILITEG

PURPOSE HILITEG prints text surrounded by a rectangular box (grayscale).

SYNTAX CALL HILITEG (XPP, YPP, HEIGHT, CSTR, ANG, EDG, JUSX, JUSY, FGRY, BGRY)

XPP,YPP	X,Y coordinates of the box surrounding the text.
HEIGHT	Height of text to be plotted.
CSTR	Character string text to be plotted.
ANG	Angle, measured counterclockwise from the X-axis, at which the text is to be plotted.
EDG	Fraction of the text height to use as an edge border.
JUSX	Justification in the x-direction. JUSX=0 is left justification. JUSX=1 is centered. JUSX=2 is right justification.
JUSY	Similar to JUSX, but in the y-direction. JUSY=0 is bottom justification. JUSY=1 is centered. JUSY=2 is top justification.
FGRY	Graylevel of the (foreground) text. FGRY must lie between 0. and 1.0, inclusive.
BGRY	Graylevel of the (background) surrounding box. BGRY must lie between 0. and 1.0, inclusive.

INTEGRAL

PURPOSE **INTEGRAL** plots an integral with upper and lower limits.

SYNTAX CALL INTEGRAL (XPP, YPP, HEIGHT, ANG, LOWER, NL, LUPPER, NU)

XPP,YPP	X,Y coordinates of the lower left edge of the integral.
HEIGHT	Height of the integral.
ANG	Angle, measured counterclockwise from the X-axis, at which the integral is plotted.
LOWER	Character string of the lower limit (Hollerith).
NL	Number of characters in the lower limit text.
LUPPER	Character string of the upper limit (Hollerith).
NU	Number of characters in the upper limit text.

KEKEXP

PURPOSE **KEKEXP** plots a floating point number in exponential format.

SYNTAX CALL KEKEXP (XPP, YPP, HEIGHT, FNUM, ANG, NDEC, MJUS)

ARGUMENTS

- XPP,YPP X,Y coordinates of the number to be plotted. Plotting may be continued from the end of a previously plotted character when used in conjunction with any of the subroutines which support continuation
- HEIGHT Height of number to be plotted.
- FNUM Floating point number to be plotted.
- ANG Angle, measured counterclockwise from the X-axis, at which the number is to be plotted.
- NDEC Controls the plotted precision of FNUM.

If NDEC > 0, it specifies the number of digits to the right of the decimal point, after rounding. If NDEC = 0, only the number's integer portion and a decimal point are plotted, after rounding. If NDEC = -1, only the number's integer portion is plotted, after rounding.

MJUS Controls the justification of the number to be plotted.

If MJUS = 0, (XPP,YPP) denotes the position of the lower left corner of the plotted number. If MJUS = 1, (XPP,YPP) denotes the position of the center of the plotted number. If MJUS = 2, (XPP,YPP) denotes the position of the lower right corner of the plotted number.

KEKFLT

PURPOSE **KEKFLT** is the same as KEKNUM.

SYNTAX CALL KEKFLT (XPP, YPP, HEIGHT, FNUM, ANG, NDEC, MJUS)

<u>ARGUMENTS</u>

Same as KEKNUM.

KEKNUM

PURPOSE **KEKNUM** plots a floating point number in floating point format.

SYNTAX CALL KEKNUM (XPP, YPP, HEIGHT, FNUM, ANG, NDEC, MJUS)

ARGUMENTS

- XPP,YPP X,Y coordinates of the number to be plotted. Plotting may be continued from the end of a previously plotted character when used in conjunction with any of the subroutines which support continuation.
- HEIGHT Height of number to be plotted.
- FNUM Floating point number to be plotted.
- ANG Angle, measured counterclockwise from the X-axis, at which the number is to be plotted.
- NDEC Controls the plotted precision of FNUM.

If NDEC > 0, it specifies the number of digits to the right of the decimal point, after rounding. If NDEC = 0, only the number's integer portion and a decimal point are plotted, after rounding. If NDEC = -1, only the number's integer portion is plotted, after rounding.

MJUS Controls the justification of the number to be plotted.

If MJUS = 0, (XPP,YPP) denotes the position of the lower left corner of the plotted number. If MJUS = 1, (XPP,YPP) denotes the position of the center of the plotted number. If MJUS = 2, (XPP,YPP) denotes the position of the lower right corner of the plotted number.

KEKSYM

PURPOSE KEKSYM plots a character string.

SYNTAX CALL KEKSYM (XPP, YPP, HEIGHT, IBCD, ANG, NCHAR, MJUS)

ARGUMENTS

- XPP,YPP X,Y coordinates of the character string to be plotted. Plotting may be continued from the end of a previously plotted character when used in conjunction with any of the subroutines which support continuation.
- HEIGHT Height of character string to be plotted.
- IBCD Character string to be plotted (Hollerith).
- ANG Angle, measured counterclockwise from the X-axis, at which the character string is to be plotted.
- NCHAR Number of characters in the string to plot.
- MJUS Controls the justification of the character string to be plotted.

If MJUS = 0, (XPP,YPP) denotes the position of the lower left corner of the character string. If MJUS = 1, (XPP,YPP) denotes the position of the center of the character string. If MJUS = 2, (XPP,YPP) denotes the position of the lower right corner of the character string.

Special feature of KEKSYM:

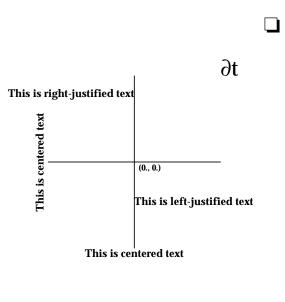

You can plot special characters, for example the characters in fonts Symbol and Zapf Dingbats, by setting NCHAR=-999 and IBCD equal to the octal code of the character you want to plot.

Example: KEKSYM

Sample code:

call keksym(0., -1.1, .08, 1 21hThis is centered text, 0., 21, 1) call keksym(-1.05, 0., .08, 1 21hThis is centered text, 90., 21, 1) call keksym(0.,-.5, .08, 1 27hThis is left-justified text, 0., 27, 0) call keksym(0., .75, .08, 1 28hThis is right-justified text, 0., 28, 2)

call setfnt(29) !Sets font to Symbol call keksym(1., 1., .15, 266, 0., -999, 0) call setfnt(28) !Sets font to Palatino-Roman call keksym(999., 999., .15, 1ht, 0., 1, 0) call setfnt(35) !Sets font to Zapf Dingbats call keksym(1.5, 1.5, .15, 157, 0., -999, 0)

KEKSYMC

- *PURPOSE* **KEKSYMC** plots a character string. Same as **KEKSYM**, but text is input as a character string rather than Hollerith.
- SYNTAX CALL KEKSYMC (XPP, YPP, HEIGHT, CSTR, ANG, NCHAR, MJUS)

ARGUMENTS

- XPP,YPP X,Y coordinates of the character string to be plotted. Plotting may be continued from the end of a previously plotted character when used in conjunction with any of the subroutines which support continuation.
- HEIGHT Height of character string to be plotted.
- CSTR Character string to be plotted (Hollerith).
- ANG Angle, measured counterclockwise from the X-axis, at which the character string is to be plotted.
- NCHAR Number of characters in the string to plot.
- MJUS Controls the justification of the character string to be plotted.

If MJUS = 0, (XPP,YPP) denotes the position of the lower left corner of the character string. If MJUS = 1, (XPP,YPP) denotes the position of the center of the character string. If MJUS = 2, (XPP,YPP) denotes the position of the lower right corner of the character string.

Special feature of KEKSYMC:

You can plot special characters, for example the characters in fonts Symbol and Zapf Dingbats, by setting NCHAR=-999 and CSTR equal to the octal code of the character you want to plot. CSTR must be in single quotes.

KEKSYMO

- *PURPOSE* **KEKSYMO** plots a character string; however, the characters are outlined rather than filled (solid).
- SYNTAX CALL KEKSYMO (XPP, YPP, HEIGHT, IBCD, ANG, NCHAR, MJUS)

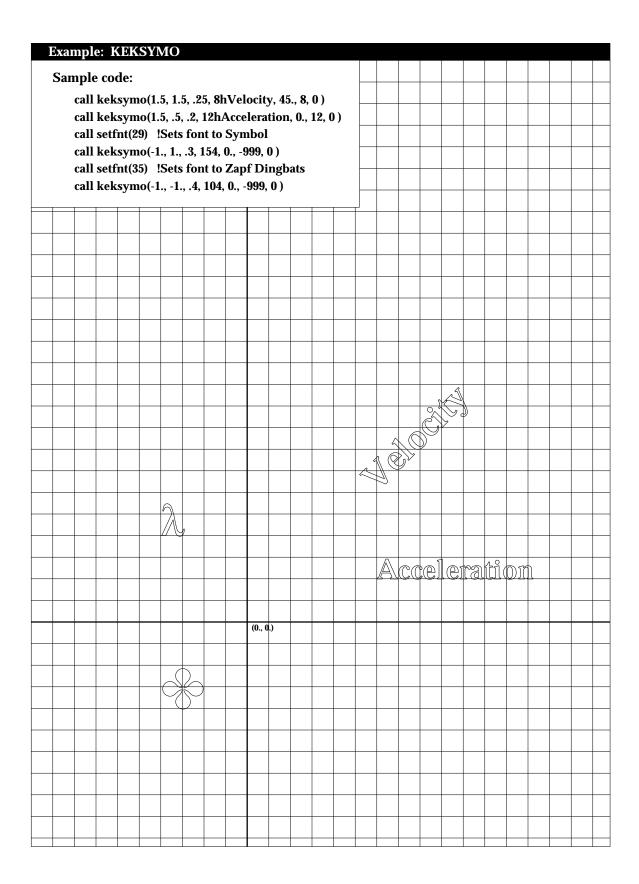

ARGUMENTS

- XPP,YPP X,Y coordinates of the character string to be plotted. Plotting may be continued from the end of a previously plotted character when used in conjunction with any of the subroutines which support continuation.
- HEIGHT Height of character string to be plotted.
- IBCD Character string to be plotted (Hollerith).
- ANG Angle, measured counterclockwise from the X-axis, at which the character string is to be plotted.
- NCHAR Number of characters in the string to plot.
- MJUS Controls the justification of the character string to be plotted.

If MJUS = 0, (XPP,YPP) denotes the position of the lower left corner of the character string. If MJUS = 1, (XPP,YPP) denotes the position of the center of the character string. If MJUS = 2, (XPP,YPP) denotes the position of the lower right corner of the character string.

Special feature of KEKSYMO:

You can plot special characters, for example the characters in fonts Symbol and Zapf Dingbats, by setting NCHAR=-999 and IBCD equal to the octal code of the character you want to plot.

LENSTR

- *PURPOSE* **LENSTR** is a function whose returned value is the number of characters in the character string argument after trailing blanks have been removed.
- *SYNTAX* LS = LENSTR(STRING, NDIM)

- STRING Character string variable.
- NDIM Maximum length of STRING as stated in calling program.
- LS Returned length of the character string STRING after trailing blanks have been removed.

NEWDEV

- *PURPOSE* **NEWDEV** specifies a non-default filename which will contain the application program's output PostScript plot file.
- SYNTAX CALL NEWDEV (FLNAME, NCHAR)

ARGUMENTS

- FLNAME Character string or FORTRAN character variable which contains the name of the output Postscript file.
- NCHAR Number of characters in the filename.

For example,

CALL NEWDEV ('MYPLOT.DAT', 10)

NEWDEV is called only once per plotting session and must be called prior to PSINIT. If NEWDEV is not called, the name of the output PostScript file is **psplot.ps**.

NUMBER

PURPOSE **NUMBER** is the same as KEKNUM with left justification.

SYNTAX CALL NUMBER (XPP, YPP, HEIGHT, FNUM, ANG, NDEC)

<u>ARGUMENTS</u>

Same as KEKNUM.

ONEHLF

 $PURPOSE \quad \textbf{ONEHLF} plots the symbol <math display="inline">\frac{1}{2}$.

SYNTAX CALL ONEHLF (XPP, YPP, HEIGHT, ANG, MJUS)

<u>ARGUMENTS</u>

XPP,YPP	X,Y coordinates of the symbol to be plotted.
HEIGHT	Height of symbol to be plotted.
ANG	Angle, measured counterclockwise from the X-axis, at which the symbol is to be plotted.
MJUS	Controls the justification of the character string to be plotted.
	If MJUS = 0, (XPP,YPP) denotes the position of the lower left corner of the character string. If MJUS = 1, (XPP,YPP) denotes the position of the center of the character string. If MJUS = 2, (XPP,YPP) denotes the position of the lower right corner of the character string.

OVERBAR

PURPOSE **OVERBAR** plots a character string with an overbar.

SYNTAX CALL OVERBAR (XPP, YPP, HEIGHT, IBCD, ANG, NCHAR, MJUS)

ARGUMENTS

- XPP,YPP X,Y coordinates of the character string to be plotted. Plotting may be continued from the end of a previously plotted character when used in conjunction with any of the subroutines which support continuation.
- HEIGHT Height of number to be plotted.
- IBCD Character string to be plotted (Hollerith).
- ANG Angle, measured counterclockwise from the X-axis, at which the character string is to be plotted.
- NCHAR Number of characters in the string to plot.
- MJUS Controls the justification of the character string to be plotted.

If MJUS = 0, (XPP,YPP) denotes the position of the lower left corner of the character string. If MJUS = 1, (XPP,YPP) denotes the position of the center of the character string. If MJUS = 2, (XPP,YPP) denotes the position of the lower right corner of the character string.

-

OVERSBSP

- *PURPOSE* **OVERSBSP** plots a subscripted and superscripted character string with an overbar. The overbar extends to cover both the subscripts and superscripts.
- SYNTAX CALL OVERSBSP (XPP, YPP, HEIGHT, IBCD, ANG, NCHAR, MJUS, ISUB, NSUB, ISUP, NSUP)

ARGUMENTS

- XPP,YPP X,Y coordinates of the character string to be plotted. Plotting may be continued from the end of a previously plotted character when used in conjunction with any of the subroutines which support continuation.
- HEIGHT Height of character string to be plotted.
- IBCD Character string to be plotted (Hollerith).
- ANG Angle, measured counterclockwise from the X-axis, at which the character string is to be plotted.
- NCHAR Number of characters in the string to plot.
- MJUS Controls the justification of the character string to be plotted.

If MJUS = 0, (XPP,YPP) denotes the position of the lower left corner of the character string. If MJUS = 1, (XPP,YPP) denotes the position of the center of the character string. If MJUS = 2, (XPP,YPP) denotes the position of the lower right corner of the character string.

- ISUB Hollerith character(s) comprising the subscript.
- NSUB Number of characters in the subscript string.
- ISUP Hollerith character(s) comprising the superscript.

NSUP Number of characters in the superscript string.

Exar	npl	e: C	OVE	RS	BSP)

OVERSBSPG

PURPOSE **OVERSBSPG** plots a subscripted and superscripted Greek symbol with an overbar. The overbar extends to cover both the subscripts and superscripts.

SYNTAX CALL OVERSBSPG (XPP, YPP, HEIGHT, ICH, ANG, CHAR, MJUS, ISUB, NSUB, ISUP, NSUP)

ARGUMENTS

X,Y coordinates of the character string to be plotted. Plotting may be continued from the end of a previously plotted character when used in conjunction with any of the subroutines which support continuation.
Height of symbol to be plotted.
Integer value between 1 and 50 corresponding to the desired Greek symbol (see table below Subroutine GRKSYM).
Angle, measured counterclockwise from the X-axis, at which the character string is to be plotted.
Number of characters in the string to plot (should be set to 1).
Controls the justification of the character string to be plotted.
If MJUS = 0, (XPP,YPP) denotes the position of the lower left corner of the character string.
If MJUS = 1, (XPP,YPP) denotes the position of the center of the character string.
If $MJUS = 2$, (XPP, YPP) denotes the position of the lower right corner of the character string.
If $MJUS = 2$, (XPP, YPP) denotes the position of the lower right corner
If MJUS = 2, (XPP,YPP) denotes the position of the lower right corner of the character string.

NSUP Number of characters in the superscript string.

Example: OVERSBSPG							
Sample code:				9		-¢	V į
call oversbspg(2., .25, .2, 35, 90., 1, 0, 1hs, 1, 1h2, 1)				τ_n^2			$\boldsymbol{<}$
call oversbspg(.5, .25, .15, 43, 0., 1, 0, 1hn, 1, 1h2, 1)							
		(0., 0	.)				

OVERSUB

PURPOSE **OVERSUB** plots a subscripted character string with an overbar. The overbar extends to cover the subscripts.

SYNTAX CALL OVERSUB (XPP, YPP, HEIGHT, IBCD, ANG, NCHAR, MJUS, ISUB, NSUB)

ARGUMENTS

- XPP,YPP X,Y coordinates of the character string to be plotted. Plotting may be continued from the end of a previously plotted character when used in conjunction with any of the subroutines which support continuation.
- HEIGHT Height of character string to be plotted.
- IBCD Character string to be plotted (Hollerith).
- ANG Angle, measured counterclockwise from the X-axis, at which the character string is to be plotted.
- NCHAR Number of characters in the string to plot.
- MJUS Controls the justification of the character string to be plotted.

If MJUS = 0, (XPP,YPP) denotes the position of the lower left corner of the character string. If MJUS = 1, (XPP,YPP) denotes the position of the center of the character string. If MJUS = 2, (XPP,YPP) denotes the position of the lower right corner of the character string.

ISUB Hollerith character(s) comprising the subscript.

NSUB Number of characters in the subscript string.

OVERSUBG

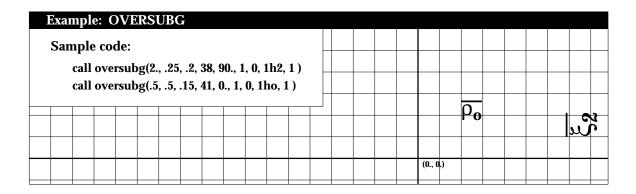

- *PURPOSE* **OVERSUBG** plots a subscripted Greek symbol with an overbar. The overbar extends to cover the subscript.
- SYNTAX CALL OVERSUBG(XPP, YPP, HEIGHT, ICH, ANG, NCHAR, MJUS, ISUB, NSUB)

ARGUMENTS

- XPP,YPP X,Y coordinates of the character string to be plotted. Plotting may be continued from the end of a previously plotted character when used in conjunction with any of the subroutines which support continuation.
- HEIGHT Height of the Greek symbol to be plotted.
- ICH Integer value between 1 and 50 corresponding to the desired Greek symbol (see table below Subroutine GRKSYM).
- ANG Angle, measured counterclockwise from the X-axis, at which the symbol is to be plotted.
- NCHAR Number of characters in the string to plot (should be set to 1).
- MJUS Controls the justification of the character string to be plotted.

If MJUS = 0, (XPP,YPP) denotes the position of the lower left corner of the symbol.
If MJUS = 1, (XPP,YPP) denotes the position of the center of the symbol.
If MJUS = 2, (XPP,YPP) denotes the position of the lower right corner of the symbol.

- ISUB Hollerith character(s) comprising the subscript.
- NSUB Number of characters in the subscript string.

OVERSUP

PURPOSE **OVERSUP** plots a superscripted character string with an overbar. The overbar extends to cover the subscript.

SYNTAX CALL OVERSUP (XPP, YPP, HEIGHT, ICH, ANG, NCHAR, MJUS,ISUP, NSUP)

ARGUMENTS

- XPP,YPP X,Y coordinates of the character string to be plotted. Plotting may be continued from the end of a previously plotted character when used in conjunction with any of the subroutines which support continuation.
- HEIGHT Height of character string to be plotted.
- IBCD Character string to be plotted (Hollerith).
- ANG Angle, measured counterclockwise from the X-axis, at which the character string is to be plotted.
- NCHAR Number of characters in the string to plot.
- MJUS Controls the justification of the character string to be plotted.

If MJUS = 0, (XPP,YPP) denotes the position of the lower left corner of the character string.
If MJUS = 1, (XPP,YPP) denotes the position of the center of the character string.
If MJUS = 2, (XPP,YPP) denotes the position of the lower right corner of the character string.

- ISUP Hollerith character(s) comprising the superscript.
- NSUP Number of characters in the superscript string.

OVERSUPG

- *PURPOSE* **OVERSUPG** plots a subscripted Greek character with an overbar. The overbar extends to cover the superscript.
- SYNTAX CALL OVERSUPG(XPP, YPP, HEIGHT, ICH, ANG, NCHAR, MJUS, ISUP, NSUP)

ARGUMENTS

- XPP,YPP X,Y coordinates of the Greek symbol to be plotted. Plotting may be continued from the end of a previously plotted character when used in conjunction with any of the subroutines which support continuation.
- HEIGHT Height of the Greek symbol to be plotted.
- ICH Integer value between 1 and 50 corresponding to the desired Greek symbol (see table below Subroutine GRKSYM).
- ANG Angle, measured counterclockwise from the X-axis, at which the symbol is to be plotted.
- NCHAR Number of characters in the string to plot (should be set to 1).
- MJUS Controls the justification of the character string to be plotted.

If MJUS = 0, (XPP,YPP) denotes the position of the lower left corner of the symbol. If MJUS = 1, (XPP,YPP) denotes the position of the center of the symbol. If MJUS = 2, (XPP,YPP) denotes the position of the lower right corner of the symbol.

ISUP Hollerith character(s) comprising the superscript.

NSUP Number of characters in the superscript string.

OVRGRK

PURPOSE **OVRGRK** plots a Greek symbol with an overbar.

SYNTAX CALL OVRGRK (XPP, YPP, HEIGHT, ICH, ANG, NCHAR, MJUS)

ARGUMENTS

- XPP,YPP X,Y coordinates of the Greek symbol to be plotted. Plotting may be continued from the end of a previously plotted character when used in conjunction with any of the subroutines which support continuation.
- HEIGHT Height of symbol to be plotted.
- ICH Integer value between 1 and 50 corresponding to the desired Greek symbol (see table below Subroutine GRKSYM).
- ANG Angle, measured counterclockwise from the X-axis, at which the symbol is to be plotted.
- NCHAR Number of characters in the string to plot (should be set to 1).
- MJUS Controls the justification of the symbol to be plotted.

If MJUS = 0, (XPP,YPP) denotes the position of the lower left corner of the symbol.

If MJUS = 1, (XPP,YPP) denotes the position of the center of the symbol.

If MJUS = 2, (XPP,YPP) denotes the position of the lower right corner of the symbol.

PLOT

- **PURPOSE PLOT** is the most fundamental user-level plotting command. It gives you direct control of pen movement (to any X,Y coordinate position) and pen status (up or down). Additionally, it allows you to re-define the current plotting origin.
- SYNTAX CALL PLOT (XPP, YPP, IPEN)

ARGUMENTS

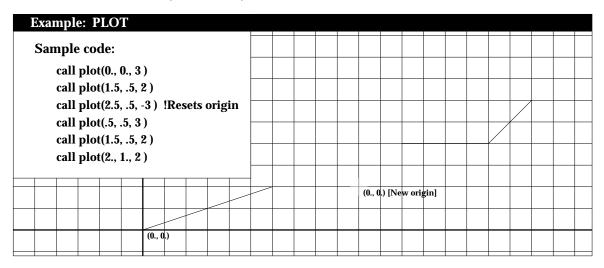

- XPP,YPP X,Y coordinates of the position to which the pen is to be moved. An origin may be established anywhere on or off the plotting surface, as explained below for negative IPEN values.
- IPEN A signed integer which controls pen status (up/down) and origin definition.

If IPEN = 2, the pen is down during movement, thus drawing a visible line.

If IPEN = 3, the pen is up during movement, thus changing the pen's current position only.

If IPEN = -2 or -3, a new origin is defined at the position (XPP,YPP) after the movement is completed as if IPEN were positive. The logical X,Y coordinates of the new pen position are set to (0,0), so that all subsequent pen movements use this position as a reference point.

If IPEN = 999, the call to PLOT closes the output file. Thus, a call to PLOT with IPEN = 999 may be used only once in a given plotting session, and if used, must be the last plotting command in the plotting session. Calling PLOT with IPEN = 999 is identical to calling PLOTND (which see).

PLOTND

- *PURPOSE* PLOTND closes the output PostScript plot file to terminate the current plot defined by the user application program.
- SYNTAX CALL PLOTND

ARGUMENTS

None

You must call PLOTND (or PLOT ($0.,\,0.,\,999)$) as the last plotting call in the application program.

PLSMIN

PURPOSE **PLSMIN** plots the symbol ±.

SYNTAX CALL PLSMIN (XPP, YPP, HEIGHT, ANG, MJUS)

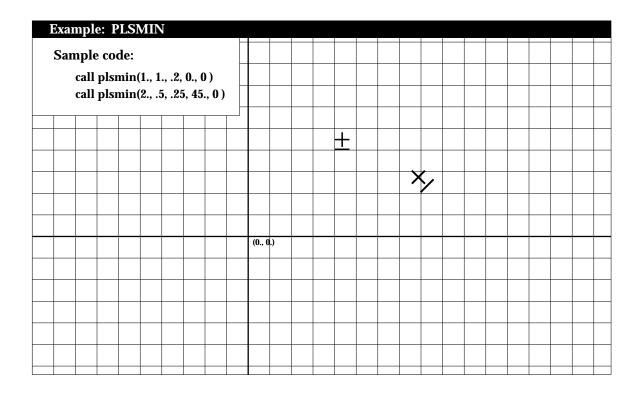

ARGUMENTS

- XPP,YPP X,Y coordinates of the symbol to be plotted. Plotting may be continued from the end of a previously plotted character when used in conjunction with any of the subroutines which support continuation.
- HEIGHT Height of symbol to be plotted.
- ANG Angle, measured counterclockwise from the X-axis, at which the symbol is to be plotted.
- MJUS Controls the justification of the character string to be plotted.

If MJUS = 0, (XPP,YPP) denotes the position of the lower left corner of the character.

If MJUS = 1, (XPP,YPP) denotes the position of the center of the character.

If MJUS = 2, (XPP,YPP) denotes the position of the lower right corner of the character.

PRIME

PURPOSE **PRIME** plots the symbol '.

SYNTAX CALL PRIME (XPP, YPP, HEIGHT, ANG, MJUS)

ARGUMENTS

- XPP,YPP X,Y coordinates of the symbol to be plotted. Plotting may be continued from the end of a previously plotted character when used in conjunction with any of the subroutines which support continuation.
- HEIGHT Height of symbol to be plotted.
- ANG Angle, measured counterclockwise from the X-axis, at which the symbol is to be plotted.
- MJUS Controls the justification of the symbol to be plotted.

If MJUS = 0, (XPP,YPP) denotes the position of the lower left corner of the character.

If MJUS = 1, (XPP,YPP) denotes the position of the center of the character.

If MJUS = 2, (XPP, YPP) denotes the position of the lower right corner of the character.

Exai	npl	e: P	RIN	ЛE														
	call	kek	sym						2, 0)	-			 					_
	call	prir	ne(9	999.,	999	., .14	l, 0.,	0)	_	-								
											dť							
									(0., 0	.)								

PSINIT

- **PURPOSE PSINIT** is called to begin a plotting session. It must be called before any other plotting command, with the exception of NEWDEV.
- SYNTAX CALL PSINIT (PRTRT)

ARGUMENTS

PRTRT Logical variable indicating the paper orientation. If PRTRT=.TRUE., the paper is oriented in portrait mode, i.e. long side of page is vertical. If PRTRT=.false., the paper is oriented in landscape mode, i.e. long side of page is horizontal.

RECT

PURPOSE **RECT** draws a rectangle (or square).

SYNTAX CALL RECT (XX1, YY1, XX2, YY2, HEIGHT)

- XX1,YY1 X,Y coordinates of lower left corner of rectangle.
- XX2,YY2 X,Y coordinates of lower right corner of rectangle.
- HEIGHT Height of rectangle.

Example: RECT				
Sample code:				
call rect(1., 1., 2., 2.	.3)			
call rect(2., .5, 3., 0.				
		+		
	(0., 0.)			

RECTFILC

- *PURPOSE* **RECTFILC** draws a rectangle (or square) and fills it with a specified red, green, and blue color levels.
- SYNTAX CALL RECTFILC (XX1, YY1, XX2, YY2, HEIGHT, RED, GREEN BLUE)

- XX1,YY1 X,Y coordinates of lower left corner of rectangle.
- XX2,YY2 X,Y coordinates of lower right corner of rectangle.
- HEIGHT Height of rectangle.
- RED, GREEN, BLUE RGB values of the fill color. Must lie between 0. and 1., inclusively.

RECTFILG

- *PURPOSE* **RECTFILG** draws a rectangle (or square) and fills it with a specified graylevel.
- SYNTAX CALL RECTFILG (XX1, YY1, XX2, YY2, HEIGHT, GRYLEV)

- XX1,YY1 X,Y coordinates of lower left corner of rectangle.
- XX2,YY2 X,Y coordinates of lower right corner of rectangle.
- HEIGHT Height of rectangle.
- GRYLEV Graylevel to use for filling rectangle. GRYLEV must lie beween 0. (black) and 1. (white), inclusive.

Example: RECTFILG			
Sample code:			
call rect(1., 1., 2., 2., .3, 0.)			
call rect(2., .5, 3., 0., .2, .8)			
	(0., 0.)		
	(0., 0.)		

ROTATE

- PURPOSEROTATE rotates the current coordinate system by a specified angle.Essentially, ROTATE issues the PostScript *rotate* command.
- SYNTAX CALL ROTATE (ANG)

ARGUMENTS

ANGLE Angle, measured counterclockwise, to rotate the current coordinate system.

RRECT

- *PURPOSE* **RRECT** draws a rectangle (or square).with rounded corners. It can then fill the rectangle with the current graylevel or RGB values.
- SYNTAX CALL RECT (XX1, YY1, WIDTH, HEIGHT, RAD, ANG, FILL)

- XX1,YY1 X,Y coordinates of lower left corner of rectangle.
- WIDTH Width of rectangle.
- HEIGHT Height of rectangle.
- RAD Radius of rectangle corner curves.
- ANG Angle of rectangle rotation.
- FILL Logical value. If FILL=.true., then the rectangle is filled with the current graylevel or RGB values; otherwise, the rectangle is outlined.

SETCOLR

PURPOSE **SETCOLR** sets the current red, green, and blue color levels.

SYNTAX CALL SETCOLR (RED, GREEN, BLUE)

- RED Red color saturation level, between 0. and 1.0.
- GREEN Green color saturation level, between 0. and 1.0.
- BLUE Blue color saturation level, between 0. and 1.0.

SETFNT

PURPOSE SETFNT sets the current font.

SYNTAX CALL SETFNT (NFONT)

ARGUMENTS

NFONT Number of desired font between 1 and 35 (see table below).

The fonts sets 29 (Symbol) and 35 (ZapfDingbats) require the octal code of the character to be plotted. See the tables on the following pages for the character sets and corresponding octal code values for these two fonts.

SETLW

PURPOSE **SETLW** sets the current linewidth.

SYNTAX CALL SETLW (RLW)

<u>ARGUMENTS</u>

RLW Line width.

After calling SETLW, RLW remains the current linewidth until SETLW is called again.

Example: SETLW									
Sample code:									
call setlw(0.)									
call plot(0., 0., 3)									
call plot(1., 1., 2)									
call setlw(.02)									
call plot(1.5, .5, 3) call plot(3., 2., 2)

SIGMA

PURPOSE **SIGMA** draws the symbol Σ , with upper and lower limits.

SYNTAX CALL SIGMA (XPP, YPP, HEIGHT, ANG, LOWER, NL, LUPPER, NU)

ARGUMENTS

- XPP, YPP X, Y coordinates of the lower left edge of the symbol.
- HEIGHT Height of the symbol.
- ANG Angle, measured counterclockwise from the X-axis, at which the symbol is to be plotted.
- LOWER Character string specifying the lower limit (Hollerith).
- NL Number of characters in the lower limit character string.
- LUPPER Character string specifying the upper limit (Hollerith).
- NU Number of characters in the upper limit character string.

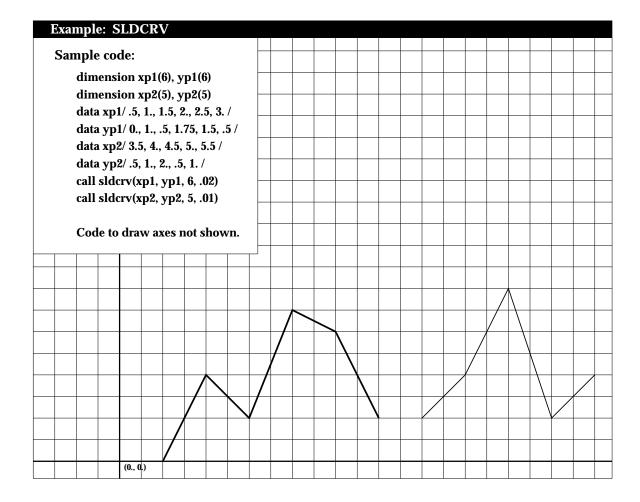

If NL (NU) is set to -999, then LOWER (LUPPER) is the octal code of the character in the font SYMBOL.

SLDCRV

- *PURPOSE* **SLDCRV** connects points in two data arrays using a line with a specified thickness.
- SYNTAX CALL SLDCRV (XARR, YARR, NPTS, THK)

- XARR Array containing the X coordinates of the data points to be plotted.
- YARR Array containing the Y coordinates of the data points to be plotted.
- NPTS Number of points in the curve.
- THK Specifies the thickness of the curve. If THK = 0., the current linewidth is used.

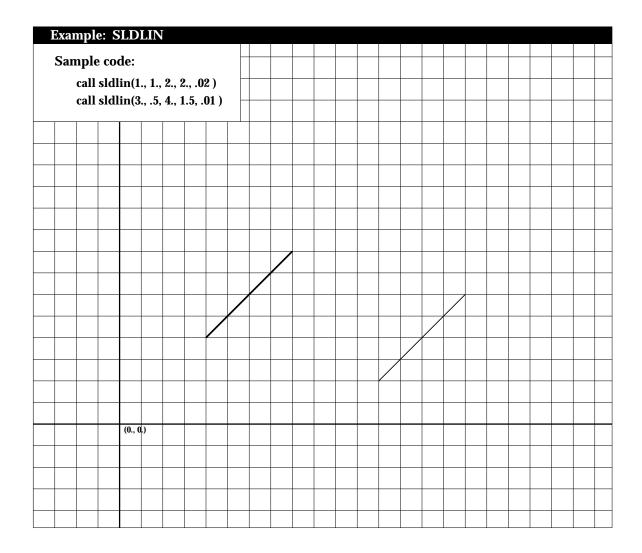

SLDLIN

PURPOSE **SLDLIN** connects two points using a line with a specified thickness.

SYNTAX CALL SLDLIN (X1, Y1, X2, Y2, THK)

- X1,Y1 X,Y coordinates of first data point.
- X2,Y2 X,Y coordinates of second data point.
- THK Specifies the thickness of the connecting line. If THK=0., the current linewidth is used.

SQRSGN

PURPOSE **SQRSGN** draws a radical (square root) sign.

SYNTAX CALL SQRSGN (XPP, YPP, HEIGHT, RLEN)

- XPP,YPP X,Y coordinates of lower left corner of the radical.
- HEIGHT Height of the radical.
- RLEN Length of the top of the radical.

Example: SQRSGN				
Sample code:				
call sqrsgn(3., 0., .2, .25)				
call sqrsgn(-1.5, .5, .4, 3.)				
	(0., 0.)		\mathbf{V}	
	(0., 0.)			

SQUARE

PURPOSE **SQUARE** draws a centered square.

SYNTAX CALL SQUARE (XC, YC, SIDE)

<u>ARGUMENTS</u>

XC,YC X,Y coordinates of the center of the square.

SIDE Length of the sides of the square.

STROKE

- *PURPOSE* **STROKE** calls the PostScript operator *stroke* (which paints or draws the current path).
- SYNTAX CALL STROKE

<u>ARGUMENTS</u>

None

SUBBER

PURPOSE **SUBBER** draws a subscript.

SYNTAX CALL SUBBER (ISUB, NSUB, SIZE, ANG)

ISUB	Hollerith variable specifying the subscript character string.
NSUB	Number of characters in the subscript.
SIZE	Height of the variable to be subscripted . It is not the height of the subscript characters themselves.
ANG	Angle of the subscripted variable.
Note:	SUBBER must be called immediately after the call to create the subscripted variable.

Example: SU	IBBER						
Sample code	2:						
call subbo call grksy	ym(.5, .5, .15, 1hQ, 0., 1, 0) er(1hs, 1, .15, 0.) ym(1., 1., .2, 43, 0., 1, 0)						
call keksy	er(1hx, 1, .2, 0.) ym(-1., .5, .15, 1hW, 45., 1, er(1he, 1, .15, 45.)	0)					
				τ_{x}			
	- N°		Q				
							\parallel
		(0., 0.)					
				1	1 1	1 1	1

SUBBERSP

PURPOSE **SUBBERSP** draws a subscript of "special" characters.

SYNTAX CALL SUBBERSP (NSET, NFNT, ITITLE, NCHR, HEIGHT, ANG

ARGUMENTS

NSET	Number of different font sets needed.
NFNT	Array holding the font numbers 1 to NSET.
ITITLE	ITITLE holds the octal codes for characters of fonts 29 or 35; otherwise, it hold the text characters themselves.
NCHR	Number of characters of a given font. Usually one, but can be greater than one for fonts other than 29 and 35.
HEIGHT	Height of the variable to be subscripted . It is not the height of the subscript characters themselves.
ANG	Angle of the subscripted variable.

Note: SUBBERSP must be called immediately after the call to create the subscripted variable.

Example: SUBBERSP							
Sample code:							
dimension nfnt(2),ititle(20,2),nchr(2) nfnt(1)=20							
nfnt(2)=29 ititle(1,1)=1h2							
ititle(1,2)=142							
nchr(1)=1 nchr(2)=1							
call keksym(.5, .5, .15, 1hQ, 0., 1, 0)							
call subbersp(1, 29, 141, 1, .15, 0.) call keksym(2., 1., .2, 1hA, 0., 1, 0)							
call subbersp(2, nfnt, ititle, nchr, .2, 0.) call keksym(-1., .5, .15, 1hW, 45., 1, 0)							
call subbersp(1, 35, 153, 1, .15, 45.)				A	2β		
*		\mathbf{Q}_{α}					
		×α					
	(0., 0.)						
	(0., 0.)						

SUBSUP

PURPOSE **SUBSUP** draws a subscript and superscript.

SYNTAX CALL SUBSUP (ISUB, NSUB, ISUP, NSUP, SIZE, ANG)

ARGUMENTS

ISUB	Hollerith variable specifying the subscript character string.
NSUB	Number of characters in the subscript.
ISUP	Hollerith variable specifying the superscript character string.
NSUP	Number of characters in the superscript.
SIZE	Height of the variable to be subscripted and superscripted . It is not the height of the subscript and superscript characters themselves.
ANG	Angle of the subscripted and superscripted variable.

Note: SUBSUP must be called immediately after the call to create the subscripted and superscripted variable.

Example: SUBSUP									
Sample code:									
call keksym(.5, .5, .15, call subsup(1h1, 1, 1h2 call grksym(1., 1., .2, 4 call subsup(1hx, 1, 2h-	2, 1, .15, 0.) 1, 0., 1, 0) 1, 2, .2, 0.)								
call keksym(-1., .5, .15 call subsup(1he, 1, 1h2)							_

SUBSUPSP

PURPOSE **SUBSUPSP** draws subscripts and superscripts of "special" characters.

SYNTAX CALL SUBSUPSP (NSUB, NFNTSB, ITITLESB, NCHRSB, NSUP, NFNTSP,ITITLESP, NCHRSP, HEIGHT, ANG)

ARGUMENTS

NSUB, NSUP	Number of different font sets needed for subscripts and superscripts, respectively.
NFNTSB, NFNTSP	Arrays holding the font numbers 1 to NSET for subscripts and superscripts, respectively.
ITITLESB, ITITLESP	Arrays holding the octal codes for characters of fonts 29 or 35; otherwise, holding text characters themselves.
NCHRSB, NCHRSP	Number of characters of a given font for subscripts and superscripts, respectively. Usually one, but can be greater than one for fonts other than 29 and 35.
HEIGHT	Height of the variable to be subscripted . It is not the height of the subscript characters themselves.
ANG	Angle of the subscripted variable.

Note: SUBSUPSP must be called immediately after the call to create the subscripted variable.

												(0., 0	.)								

SUPER

PURPOSE **SUPER** draws a superscript.

SYNTAX CALL SUPER (ISUP, NSUP, SIZE, ANG)

ARGUMENTS

ISUP	Hollerith variable specifying the superscript character string.
NSUP	Number of characters in the superscript.
SIZE	Height of the variable to be superscripted . It is not the height of the subscript characters themselves.
ANG	Angle of the superscripted variable.

Note: SUPER must be called immediately after the call to create the superscripted variable.

Example: SUPER									
Sample code:									
call keksym(.5, .5, .15, 11 call super(1h2, 1, .15, 0.) call grksym(1., 1., .2, 41,	0., 1, 0)								
call super(2h-1, 2, .2, 0.) call keksym(-1., .5, .15, 1									
call super(1h2, 1, .15, 45.

SUPERSP

PURPOSE **SUPERSP** draws a superscript of "special" characters.

SYNTAX CALL SUPERSP (NSET, NFNT, ITITLE, NCHR, HEIGHT, ANG)

ARGUMENTS

NSET	Number of different font sets needed.
NFNT	Array holding the font numbers 1 to NSET.
ITITLE	ITITLE holds the octal codes for characters of fonts 29 or 35; otherwise, it hold the text characters themselves.
NCHR	Number of characters of a given font. Usually one, but can be greater than one for fonts other than 29 and 35.
HEIGHT	Height of the variable to be superscripted . It is not the height of the superscript characters themselves.
ANG	Angle of the superscripted variable.

Note: SUPERSP must be called immediately after the call to create the superscripted variable.

nfnt nfnt	ension nfi (1)=20 (2)=29		e(20,2),	nchr(2)							
ititle nchr	(1,1)=1h2 (1,2)=142 (1)=1 (2)=1										
call call s call	keksym(.5 supersp(1 keksym(2 supersp(2	, 29, 141, 1 ., 1., .2, 1h	1, .15, (nA, 0., 1).) l, 0)							
call	keksym(- supersp(1	1., .25, .15	5, 1hW	45., 1, 0				A	2β		
			n		Q	<u>.</u>					
								1			

SYMBOL

- *PURPOSE* **SYMBOL** plots a character string. It is similar to subroutine KEKSYM, except that justification and continuation are not supported.
- SYNTAX CALL SYMBOL (XPP, YPP, HEIGHT, IBCD, ANG, NCHAR)

ARGUMENTS

XPP,YPP X,Y coordinates of the lower left corner of the first character of the string to be plotted.
HEIGHT Height of character string to be plotted.
IBCD Character string to be plotted (Hollerith).
ANG Angle, measured counterclockwise from the X-axis, at which the character string is to be plotted.
NCHAR Number of characters in the string.
