

## **Unit 1      Indices and logarithms**

### **Learning Objectives**

The students should be able to:

- I    Use the laws of indices to solve simple problems.
- I    Use the properties of logarithms to solve simple problems.

## Indices

In dealing with expressions containing exponents along with addition or subtraction or multiplication or division, we work with the exponents first. Lets consider the following examples.

**Example 1** (a)  $3^2 - 2^3 = 9 - \underline{\quad} = \underline{\quad}$

(b)  $2^4 + 5^3 = 16 + \underline{\quad} = \underline{\quad}$

(c)  $3 \times 10^4 = 3 \times \underline{\quad} = 30000$

**Example 2** Write each of the following in another way by using exponents.

(a)  $(ab)(ab)(ab)$

(b)  $-a.a.a.a$

(c)  $4.a.b.4.b.a.a.a$

Solution:

(a)  $(ab)(ab)(ab) = (ab)^{\underline{\quad}}$   
 $= a^{\underline{\quad}} b^{\underline{\quad}}$

(b)  $-a.a.a.a = -a^{\underline{\quad}}$

(c)  $4.a.b.4.b.a.a.a.b = 4^2 a^{\underline{\quad}} b^{\underline{\quad}}$

**Example 3** Evaluate each of the following :

(a)  $-3^4$

(b)  $(-3)^4$

(c)  $2(1.1)^3$

Solution:

(a)  $-3^4 = -1(3)^4 = -1.3.3.\underline{\quad}.\underline{\quad} = -\underline{\quad}$

(b)  $(-3)^4 = (-3)(-3)(\underline{\quad})(\underline{\quad}) = \underline{\quad}$

(c)  $2(1.1)^3 = 2 \times 1.1^3$

$= 2 \times \underline{\quad} = \underline{\quad}$

**1. Multiplication of Exponential Numbers**

Consider

$$2^3 \cdot 2^4 = (2.2.2)(2.2.2.2)$$

$$= 2.2.2.2.2.2$$

$$= 2^7$$

$$a^2 \cdot a^3 = (a.a)(a.a.a)$$

$$= a.a.a.a.a$$

$$= a^5$$

In general,

$$a^m \cdot a^n = a^{m+n}$$

**2. Division of Exponential Numbers**

Consider

$$\frac{4^7}{4^3} = \frac{4.4.4.4.4.4.4}{4.4.4}$$

$$= 4^4$$

$$\frac{a^5}{a^3} = \frac{a.a.a.a.a}{a.a.a}$$

$$= a^2$$

In general ,

$$\frac{a^m}{a^n} = a^{m-n}$$

**Example 4** Simplify the following :

- a)  $\frac{3^{19}}{3^{11}} = 3^{19-11} = \underline{\quad}$
- b)  $\frac{X^9}{X^3} = X^{\quad} = \underline{\quad}$
- c)  $\frac{a^{10}b^8}{a^3b^5} = a^{10-3}b^{\quad} = a^7b^{\quad}$

Consider

$$\frac{a^n}{a^n} = a^{n-n}$$

$$= a^0 \dots\dots\dots(1)$$

On the other hand

$$\frac{a^n}{a^n} = 1 \dots\dots\dots(2)$$

Compare (1) & (2):

$$a^0 = 1$$

where a is any real number and a ≠ 0

For examples,

$$2^0 = 1, \quad (-3)^0 = 1 \quad \text{and} \quad 10^0 = 1$$

Recall  $\frac{a^m}{a^n} = a^{m-n} \dots\dots\dots (*)$

Consider  $\frac{2^3}{2^4} = \frac{2 \cdot 2 \cdot 2}{2 \cdot 2 \cdot 2 \cdot 2} = \frac{1}{2}$

Consider  $\frac{3^4}{3^6} = \frac{3 \cdot 3 \cdot 3 \cdot 3}{3 \cdot 3 \cdot 3 \cdot 3 \cdot 3 \cdot 3} = \frac{1}{3^2}$

If we use the division rule (\*)

$$\frac{2^3}{2^4} = 2^{3-4} = 2^{-1}$$

$$\therefore 2^{-1} = \frac{1}{2}$$

If we use the division rule (\*)

$$\frac{3^4}{3^6} = 3^{4-6} = 3^{-2}$$

$$\therefore 3^{-2} = \frac{1}{3^2}$$

In general  $a^{-n} = a^{0-n} = \frac{a^0}{a^n}$

$$\boxed{a^{-n} = \frac{1}{a^n}}$$

$$\boxed{(a b)^n = a^n b^n} \quad \boxed{\left(\frac{a}{b}\right)^n = \frac{a^n}{b^n}} \quad \boxed{(a^m)^n = a^{mn}}$$

**Example 5** Simplify the following :

(a)  $(a^2 b)^3$

(b)  $\left(\frac{x^3}{y}\right)^2 (y^3)^2$

Solution :

(a)  $(a^2 b)^3 = a^6 b^3$

(b)  $\left(\frac{x^3}{y}\right)^2 (y^3)^2 = x^6 y^{-2} y^6 = x^6 y^4$

**Example 6** Carry out each of the following operation. Write all answers with positive exponents and simplify where possible.

(a)  $7^{-1}$

(b)  $2^{-4}$

(c)  $5(5^{-3})$

(d)  $\frac{2^{-5}}{2^3}$

Solutions:

(a)  $7^{-1} = \frac{1}{7}$

(b)  $2^{-4} = \frac{1}{2^4} = \frac{1}{16}$

$$\begin{aligned} \text{(c)} \quad 5(5^{-3}) &= 5^1 \times 5^{-3} \\ &= 5^{1+(-3)} = 5^{-2} \\ &= \frac{1}{5^2} \quad \text{or} \quad \frac{1}{25} \end{aligned}$$

$$\begin{aligned} \text{(d)} \quad \frac{2^{-5}}{2^3} &= 2^{-5-3} = 2^{-8} \\ &= \frac{1}{2^8} \quad \text{or} \quad \frac{1}{256} \end{aligned}$$

### 3. Radicals

If  $x^2 = y$ , then  $x$  is a square root of  $y$

for example  $7^2 = 49$

$$\therefore 7 = \sqrt[2]{49} \quad \text{or} \quad 7 = \sqrt{49}$$

similarly,  $\sqrt{81} = 9$  ( $\because 9^2 = 81$ )

If  $x^3 = y$ , then  $x$  is a cube root of  $y$

for example,  $4^3 = 64$  ( $\because \sqrt[3]{64} = 4$ )

In general, if  $x^n = y$ , where  $n$  is a positive integer, then  $x$  is a  $n^{\text{th}}$  root of  $y$ .

for example,  $2^4 = 16$

$$\therefore \sqrt[4]{16} = 2$$

**Example 7** Find the values of the following :

- (a)  $\sqrt[6]{64}$   
 (b)  $\sqrt[5]{100000}$   
 (c)  $\sqrt[4]{81}$

Solution :

(a)  $\sqrt[6]{64} = \underline{\quad}$   
 (  $\quad \quad \quad \because 2^6 = 64$  )

(b)  $\sqrt[5]{100000} = \underline{\quad}$   
 (  $\quad \quad \quad \because 10^5 = 100000$  )

(c)  $\sqrt[4]{81} = \underline{\quad}$   
 (  $\because 3^4 = 81$  )

Consider  $144 = 9 \cdot 16$   
 and  $\sqrt{144} = 12$   
 $\sqrt{9} \cdot \sqrt{16} = 3 \cdot 4$   
 $\quad \quad \quad = 12$   
 $\therefore \sqrt{144} = \sqrt{9} \sqrt{16}$   
 $\sqrt{9 \cdot 16} = 3 \cdot 4$

In general  $\boxed{\sqrt{ab} = \sqrt{a} \sqrt{b}}$

$$\boxed{\sqrt{\frac{a}{b}} = \frac{\sqrt{a}}{\sqrt{b}}}$$

Note that  $\sqrt{a+b} \neq \sqrt{a} + \sqrt{b}$

e.g.  $\sqrt{25} = \sqrt{16+9}$   
 but  $\sqrt{16} + \sqrt{9} = 4 + 3 = 7$   
 $\sqrt{25} = 5$   
 $\therefore \sqrt{16+9} \neq \sqrt{16} + \sqrt{9}$

In general  $\boxed{\sqrt[n]{\frac{a}{b}} = \frac{\sqrt[n]{a}}{\sqrt[n]{b}}}$

$$\boxed{\sqrt[n]{ab} = \sqrt[n]{a} \sqrt[n]{b}}$$

**Example 8** Find the values of the following functions :

- (a)  $f(x) = \sqrt{\frac{x}{64}}$  when  $x = 25$   
 (b)  $f(x) = x^{0.5}$  when  $x = 0.027$

Solution :

$$(a) \quad f(25) = \sqrt{\frac{25}{\quad}} = \frac{\sqrt{25}}{\sqrt{\quad}}$$

$$= \frac{5}{\quad}$$

$$(b) \quad f(0.027) = \sqrt[3]{\frac{27}{\quad}} = \frac{\sqrt[3]{27}}{\sqrt[3]{\quad}}$$

$$= \frac{3}{\quad} \text{ or } 0.3$$

#### 4. Fractional Indices

Consider  $\left(a^{\frac{1}{n}}\right)^n = a^{\frac{1}{n} \cdot n}$

$$= a^1 = a$$

$$\therefore a^{\frac{1}{n}} = \sqrt[n]{a}$$

Similarly,  $a^{\frac{m}{n}} = (\sqrt[n]{a})^m = \sqrt[n]{a^m}$

**Example 9** Evaluate the following:

(a)  $81^{\frac{3}{4}}$                       (b)  $1000^{\frac{2}{3}}$                       (c)  $\left(\frac{9}{25}\right)^{\frac{1}{2}}$

Solutions:

(a)  $81^{\frac{3}{4}} = (\sqrt[4]{\quad})^3 = (\quad)^3 = \underline{\quad}$                       (b)  $1000^{\frac{2}{3}} = (\sqrt[3]{\quad})^2 = (10)^2 = \underline{\quad}$

(c)  $\left(\frac{9}{25}\right)^{\frac{1}{2}} = \sqrt{\frac{9}{\quad}} = \frac{\sqrt{9}}{\sqrt{\quad}} = \frac{3}{\quad}$

**Example 10** In the compound interest formula  $A = P(1+r)^n$ , if  $A = 54874.32$ ,  $P = 25000$ ,  $n = 6$ , find the value of  $r$ .

Solution:  $A = P(1+r)^n$   
 $54874.32 = (25000)(1+r)^6$   
 $\frac{54874.32}{25000} = (1+r)^6$   
 $\therefore 1+r = \sqrt[6]{\frac{54874.32}{25000}}$   
 $1+r = \underline{\hspace{2cm}}$   
 $r = \underline{\hspace{2cm}} - 1$   
 $= 0.14$   
 $= \underline{\hspace{2cm}}\%$

## 5. Definition of Logarithms

If a number  $X = a^y$ , where  $a$  is positive and  $a \neq 1$ , the index  $y$  is called the **logarithm** of the number  $X$  to the base  $a$ . In symbol,  $y = \log_a X$ .

N.B.  $\log_a X$  is undefined only for positive values of  $X$

For example,  $2^3 = 8$   
 $\therefore \log_2 8 = 3$   
 $3^4 = 81$   
 $\therefore \log_3 81 = 4$

When the base  $a$  is not stated in  $\log_a X$ , it may be assumed  $a = 10$ . This is called the **common logarithm**.

For example,  $\log 1000 = \log_{10} 1000$   
 $= 3$

$$\log 0.01 = -2$$

$$\left( \because 10^{-2} = \left( \frac{1}{10^2} \right) = \underline{\hspace{2cm}} \right)$$

**6. Properties of Logarithms :**

1.  $\log_a a = 1$
2.  $\log_a 1 = 0$
3.  $\log_a MN = \log_a M + \log_a N$
4.  $\log_a \frac{M}{N} = \log_a M - \log_a N$
5.  $\log_a X^n = n \log_a X$

**Example 11** Find the values of the following:

- (a)  $\log_7 11 + \text{Log}_7 \left( \frac{1}{11} \right)$
- (b)  $\log 6 - \log 60$
- (c)  $\log_5 125$

Solution:

- (a)  $\log_7 11 + \log_7 \left( \frac{1}{11} \right)$   
 $\log_7 \left( 11 \times \frac{1}{11} \right) = \log_7 1 = \underline{\hspace{2cm}}$
- (b)  $\log 6 - \log 60$   
 $\log \frac{6}{60} = \log \frac{1}{10}$   
 $\log 10^{-1} = \underline{\hspace{2cm}}$
- (c)  $\log_5 125$   
 $= \log_5 5^3$   
 $= 3 \log_5 \underline{\hspace{1cm}}$   
 $= \underline{\hspace{2cm}}$

**Example 12** In the compound interest formula  $A = P(1 + r)^n$ , if  $A = 20000$ ,  
 $P = 10000$ ,  
 $r = 12\%$ , find  $n$  correct to 2 decimal places.

Solutions:  $A = P(1 + r)^n$   
 $20000 = 10000(1 + 12\%)^n$   
 $\frac{20000}{10000} = (1 + 0.12)^n$   
 $2 = (1.12)^n$

Taking logarithm on both sides,  $\log 2 = \log(1.12)^n$

$$\log 2 = n \log 1.12$$

$$\therefore n = \frac{\log 2}{\log 1.12}$$

$$n = \underline{\hspace{2cm}}$$

$$= \underline{\hspace{2cm}}$$
