

Unit 4: Quadratic equations in one unknown

Learning Objectives

The students should be able to:

- I Define a quadratic equation and its solutions (roots)
- I Solve quadratic equations by factorization
- I Solve quadratic equations by the quadratic formula
- I Determine the nature of the roots by the discriminant or the quadratic graph
- I Find the sum of roots and the product of roots
- I Solve practical problems leading to quadratic equations
- I Form quadratic equations with given roots

Quadratic equations in one unknown

1. What is a quadratic equation?

A quadratic equation is an equation that can be written as $ax^2 + bx + c = 0$, where a , b and c are constants and $a \neq 0$.

| Eg. 1 | Determine if the following equations are quadratic equations | Explanation |
|-------|--|--|
| | a) $2x^2 + 3x - 4 = 0$ | Yes, form correct, $a \neq 0$ |
| | b) $2x^2 + 3x = 0$ | ____, form correct, $a \neq 0$, $c = 0$ |
| | c) $2x^2 - 4 = 0$ | ____, form correct, $a \neq 0$, $b = 0$ |
| | d) $2x^2 + 3x - 4 = x^2 - x + 3$ | ____, after rearrangement: form correct, $a \neq 0$ |
| | e) $2x^2 + 3x - 4 = 2(x - 1)^2$ | ____, after rearrangement: $a = 0$ |
| | f) $2x^2 + 3\sqrt{x} - 4 = 0$ | ____, should not contain non-integral power of x . |

A solution (root) of an equation is a real number that satisfies the equation when it replaces the variable of the equation. In other words, LHS=RHS after substitution.

e.g. 3 is a solution of $x^2 - 9 = 0$ because $3^2 - 9 = 0 =$ the RHS.

e.g. 2 is not a solution of $x^2 - 9 = 0$ because $2^2 - 9 = -5 \neq$ the RHS.

2. How to solve a quadratic equation?

2.1 By factorization

- If $xy = 0$ then either $x = 0$ or $y = 0$.

Similarly, if $ax^2 + bx + c = 0$ can be written as $(dx + e)(fx + g) = 0$, then either $dx + e = 0$ or $fx + g = 0$.

Both of the equations may be solved readily.

| Eg. 2 | Solve $x^2 + 3x + 2 = 0$ | Explanation |
|----------|---|----------------------------|
| Solution | $x^2 + 3x + 2 = 0$ $(x + 1)(x + 2) = 0$ $x + 1 = 0$ or $x + 2 = 0$ $x = -1$ or $x = -2_{\#}$ | Factorization Optional. |

| | | |
|----------|--|---|
| Eg. 3 | Solve $x^2 - 8 = 1$ | |
| Solution | $x^2 - 8 = 1$ $x^2 - 9 = 0$ $(x + \underline{\quad})(x - \underline{\quad}) = 0$ $x = -\underline{\quad} \text{ or } \underline{\quad}\#$ | Convert the equation into the standard form Factorization. |
| Eg. 4 | Solve $6x^2 + 23x + 21 = 0$ | |
| Solution | $6x^2 + 23x + 21 = 0$ $(2x + \underline{\quad})(3x + \underline{\quad}) = 0$ $x = \frac{-\underline{\quad}}{2} \text{ or } \frac{-7}{\underline{\quad}\#}$ | Factorization. |

There are a few drawbacks of the factorization method. Firstly, when $a \neq 1$, the factorization may not be done easily. Secondly, there are quadratic equations that cannot be factorized without using surds; $x^2 + x - 1 = 0$ is an example.

2.2 By formula

- $$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

| | | |
|----------|---|-------------------------|
| Eg. 5 | Solve $x^2 + 3x + 2 = 0$ | Explanation |
| Solution | $x^2 + 3x + 2 = 0$ $x = \frac{-3 \pm \sqrt{\underline{\quad}^2 - 4(\underline{\quad})(2)}}{2(\underline{\quad})}$ $= \frac{-\underline{\quad} \pm 1}{\underline{\quad}}$ $= -\underline{\quad} \text{ or } -\underline{\quad}\#$ | $a = 1, b = 3, c = 2.$ |
| Eg. 6 | Solve $x^2 - 8 = 1$ | |
| Solution | $x^2 - 8 = 1$ $x^2 - 9 = 0$ $x = \frac{0 \pm \sqrt{-4(1)(-\underline{\quad})}}{2(\underline{\quad})}$ $= \underline{\quad} \text{ or } -\underline{\quad}\#$ | $a = 1, b = 0, c = -9.$ |
| Eg. 7 | Solve $6x^2 + 23x + 21 = 0$ | |
| Solution | $6x^2 + 23x + 21 = 0$ $x = \frac{-\underline{\quad} \pm \sqrt{\underline{\quad}^2 - 4(\underline{\quad})(\underline{\quad})}}{2(\underline{\quad})}$ $x = \frac{-3}{\underline{\quad}} \text{ or } \frac{-7}{3\#}$ | |

| | | |
|----------|--|--|
| Eg. 8 | Solve $x^2 + x - 1 = 0$ | |
| Solution | $x^2 + x - 1 = 0$ $x = \frac{-1 \pm \sqrt{1^2 - 4(\quad)(-1)}}{2(\quad)}$ $= \frac{-1 - \sqrt{\quad}}{2} \text{ or } \frac{-1 + \sqrt{\quad}}{\quad} \#$ | |
| Eg. 9 | Solve $x^2 + x + 1 = 0$ | |
| Solution | $x^2 + x + 1 = 0$ $x = \frac{-\quad \pm \sqrt{1^2 - 4(\quad)(\quad)}}{2(\quad)}$ $= \frac{-1 \pm \sqrt{-\quad}}{\quad}$ <p>$\therefore \sqrt{-3}$ is not real, there are no real roots.</p> | |

3. Solve practical problems leading to quadratic equations

Step 1: Let the unknown variable be x , say.

Step 2: Set up a quadratic equation in x according to the given conditions.

Step 3: Solve the quadratic equation to find the solutions.

Step 4: Check if the value of the solution is valid and reject invalid values.

| | | |
|----------|---|---|
| Eg. 10 | The difference between two numbers is 6 and their product is 247. Find the two numbers. | |
| Solution | <p>Let the smaller number be x. Then the larger number would be $x + 6$.</p> $x(x + \quad) = 247$ $x^2 + \quad x - 247 = 0$ $(x - \quad)(x + \quad) = 0$ $x = \quad \text{ or } -\quad$ <p>The two numbers are (13, \quad) or ($-\quad$, -19)</p> | <p>Step 1</p> <p>Step 2</p> <p>Step 3</p> |
| Eg. 11 | The length of a rectangle is 6cm longer than its width. The area of the rectangle is 16cm^2 . Find the length of the rectangle. | |
| Solution | <p>Let the length be x. Then the width would be $x - 6$.</p> $x(x - \quad) = 16$ $x^2 - \quad x - 16 = 0$ $(x - \quad)(x + \quad) = 0$ $x = \quad \text{ cm } (x < 0 \text{ is rejected})$ | |

| | | |
|----------|---|---|
| Eg. 12 | <p>The speed of the water current is x km/hr. The speed of a boat in still water is x^2 km/hr. After 1.5 hours upstream and 1 hour downstream, the boat has moved 26 km.</p> <p>a) Write an equation in x b) Find x (correct to 2 dp)</p> | |
| Solution | <p>a) Total distance = distance travelled upstream + distance travelled downstream (1) Distance = speed \times time (2) By (1) and (2): $26 = (x^2 - \underline{\quad})(1.5) + (x^2 + \underline{\quad})(1)$ $2.5x^2 - \underline{\quad}x - 26 = 0$ $5x^2 - x - \underline{\quad} = 0$</p> <p>b) $x = \frac{1 \pm \sqrt{(-\underline{\quad})^2 - 4(5)(\underline{\quad})}}{2(\underline{\quad})}$ $x = \underline{\quad}$ km/hr ($x < 0$ is rejected)</p> | <p>Step 2, the key equation.</p> <p>Step 2</p> <p>Step 3</p> <p>Step 4.</p> |

4. Nature of roots

4.1 Discriminant and the number of roots of a quadratic equation

The discriminant, Δ (read as delta), is defined as

$$\Delta = b^2 - 4ac$$

Its value tells the number of distinct real roots of a quadratic equation.

$$\therefore x = \frac{-b \pm \sqrt{\Delta}}{2a} = -\frac{b}{a} \pm \frac{\sqrt{\Delta}}{2a},$$

$$\therefore \Delta > 0 \quad \Leftrightarrow \quad 2 \text{ distinct real roots}$$

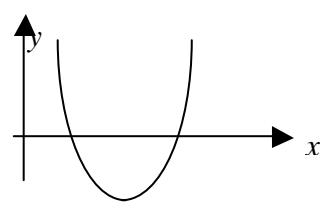

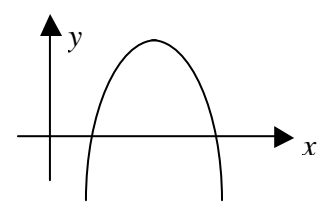

$$\Delta = 0 \quad \Leftrightarrow \quad 2 \text{ equal real roots or one distinct real root}$$

$$\Delta < 0 \quad \Leftrightarrow \quad \text{no real root}$$

| | | |
|----------|--|--|
| Eg. 13 | <p>Determine the nature of the roots of</p> <p>a) $x^2 + 2x - 1 = 0$ b) $x^2 + 2x = 0$ c) $x^2 + 2x + 1 = 0$ d) $x^2 + 2x + 2 = 0$</p> | |
| Solution | <p>a) $\Delta = 2^2 - 4(\underline{\quad})(-\underline{\quad}) = \underline{\quad} > \underline{\quad}$ 2 real roots</p> <p>b) $\Delta = 2^2 - 4(\underline{\quad})(\underline{\quad}) = \underline{\quad} > \underline{\quad}$ 2 real roots</p> <p>c) $\Delta = 2^2 - 4(\underline{\quad})(\underline{\quad}) = 0$ equal root</p> <p>d) $\Delta = 2^2 - 4(\underline{\quad})(\underline{\quad}) = -\underline{\quad} < 0$ no real root</p> | |

4.2 The shape of a quadratic graph

If we plot $y = ax^2 + bx + c$, then we will have two cases:

| | |
|---|---|
| $a > 0$, the graph open upwards | $a < 0$, the graph open downwards |
|  |  |

The roots of $ax^2 + bx + c = 0$ are the x -values of the points with $y = 0$.

\Rightarrow the roots of $ax^2 + bx + c = 0$ are the x -intercepts of the graph $y = ax^2 + bx + c$

\Rightarrow the roots $ax^2 + bx + c = 0$ can be read from the graph $y = ax^2 + bx + c$.

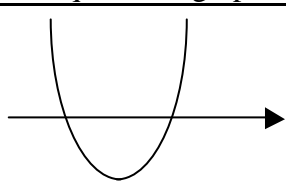

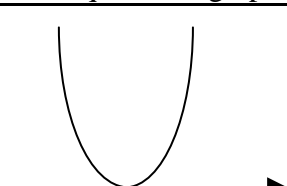

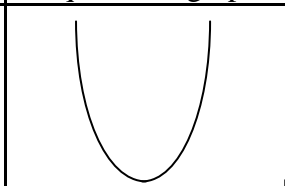

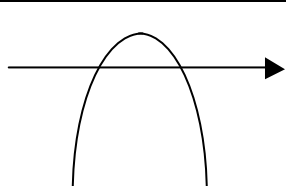

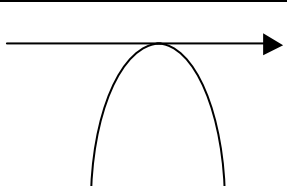

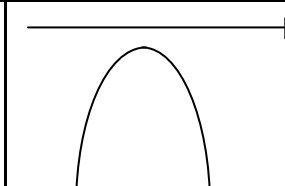

Example: Read from the graph to fill in the following table.

| | | |
|--------------|--|--|
| Condition | $y > 0$ | $y = 0$ |
| Value of x | $x > \underline{\quad}$ or $x < \underline{\quad}$ | $\underline{\quad}, \underline{\quad}$ |
| Condition | $x^2 - 4x + 3 < 0$ | $x^2 - 4x + 3 = 0$ |
| Value of x | $\underline{\quad} < x < \underline{\quad}$ | $\underline{\quad}, \underline{\quad}$ |

4.3 Discriminant and the number of x-intercepts of the quadratic graph

Because each x -intercept is a root, we have

| | | | |
|---------|---|---|--|
| | $\Delta > 0 \Leftrightarrow$ two x -intercepts of the quadratic graph | $\Delta = 0 \Leftrightarrow$ one x -intercept of the quadratic graph | $\Delta < 0 \Leftrightarrow$ no x -intercept of the quadratic graph |
| $a > 0$ |  |  |  |
| $a < 0$ |  |  |  |
