

## Unit 3 Study Guide, Part 1

### Chemical Bonding - Ionic

#### Targets:

**E5.** *Describe how atoms are joined by chemical bonding.*

**H9.** *Demonstrate an understanding that energy can be found in chemical bonds and can be used when it is released from those bonds.*

#### **Activity #1 – Introduction to Ionic Bonding**

Open [Chemical Bonding](#). Define the words and answer the questions. The definitions can be found by clicking on the word in the reading.

- 1) Define:
  - a) element
  - b) compound
- 2) There are 118 or so elements on the periodic table. Why are there many more than 118 substances found in nature?
- 3) What did the American chemist Gilbert Newton Lewis propose in 1916 about the reason for chemical bonding?
- 4) Define
  - a) valence shell
  - b) valence electrons
- 5) Lewis determined that elements are most stable when they contain how many electrons in their outer shell?
- 6) What do elements with incomplete valence shells tend to do?

7) Define

- a) ion
- b) ionic bond
- c) ionic compound

8) Watch the Flash movie showing the [reaction of sodium and chlorine](#).

a) Describe the properties of :

- i) sodium:
- ii) chlorine:

b) Drop the sodium into the chlorine gas. What happens?

c) Magnify the reaction.

- i) Does sodium lose or gain an electron?
- ii) Does chlorine lose or gain an electron?
- iii) What is the charge of the sodium ion?
- iv) What is the charge of the chlorine ion?
- v) What holds the sodium and chlorine ions together?

d) Click “What compound is formed?”.

- i) What is the common name for sodium chloride?
- ii) Describe the properties of sodium chloride.

iii) Do compounds keep the properties of the elements that make them up?  
Explain.

## Activity #2 – Bohr Diagram Review

Open 3.3.1a - [Bohr Diagram](#). Read the explanation of Bohr diagrams. In this tutorial  $p^+$  is the symbol for a proton and  $e^-$  is the symbol for an electron.

Remember that

- the total number of electrons in a neutral atom is equal to the number of protons given by the atomic number on the periodic table
- the maximum number of electrons in the 1<sup>st</sup> energy level is 2 and in the 2<sup>nd</sup> energy level is 8

1) Look at a periodic table and the Bohr diagrams above.

- In what group are hydrogen and lithium on the periodic table? \_\_\_\_ A
- How many valence electrons (electrons in the outer shell) do hydrogen and lithium have? \_\_\_\_\_

**Remember: For A group representative elements, group # = # of valence  $e^-$**

- 2) Atoms that have full valence shells are very stable (chemically inert) and do not tend to form compounds. In what group would you find the most stable elements on the periodic table? Why? Check your answer [here](#).
- 3) Draw Bohr diagrams for the following noble gases. Fill in the group number and the number of valence electrons (electrons outermost energy level). (Check your answers [here](#)).

- helium (He)
- neon (Ne)
- argon (Ar)

- 4) Why do you think helium (with 2 valence electrons) is in the same group as the other noble gases (with 8 valence electrons)?

Read [Introduction to Ionic Compounds](#) and fill in the blanks.

- 5) The formation of an **IONIC BOND** is the result of the \_\_\_\_\_ of one or more \_\_\_\_\_ from a \_\_\_\_\_ onto a \_\_\_\_\_.

\_\_\_\_\_, with only a few electrons in the outer energy level, tend to \_\_\_\_\_ electrons most readily. The energy required to remove an electron from a neutral atom is called the \_\_\_\_\_.

\_\_\_\_\_, which lack only one or two electrons in the outer energy level have little tendency to lose electrons - the ionization potential would be very high. Instead \_\_\_\_\_ have a tendency to \_\_\_\_\_ electrons. The \_\_\_\_\_ is the energy given off by an atom when it gains electrons.

Read [Formation of Positive Ions](#).

### Sodium Positive Ion, $\text{Na}^{1+}$

To form the ion lose one electron to form the Octet.

- 6) Consider the group 1A metal, potassium (K).
- Predict how many valence electrons potassium will have. \_\_\_\_
  - Verify your answer to part a by drawing a Bohr diagram. Check your diagram [here](#).
  - What is the nearest noble gas (from question #3) to potassium?
  - How will potassium complete its octet?
  - What charge would a potassium ion have?
  - Draw the Lewis symbol for a potassium ion and check [here](#). (Note: if the charge is +1 or -1, the numeral "1" can be left out and can be written as + or -)

7) Consider the group 2A metal, calcium (Ca).

- a) Predict how many valence electrons calcium will have. \_\_\_\_
- b) Verify your answer to part a by drawing a Bohr diagram. Check your diagram [here](#).
- c) What is the nearest noble gas (from question #3) to calcium?
- d) How will calcium complete its octet?
- e) What charge would a calcium ion have?
- f) Draw the Lewis symbol for a calcium ion and check [here](#).

Read [Formation of Negative Ions](#).

**Fluoride Negative Ion,  $F^{1-}$**

To form the ion add one electron to form the Octet.

8) Consider the group 7A nonmetal, chlorine (Cl).

- a) Predict how many valence electrons chlorine will have. \_\_\_\_
- b) Verify your answer to part a by drawing a Bohr diagram. Check your diagram [here](#).
- c) What is the nearest noble gas (from question #3) to chlorine?
- d) How will chlorine complete its octet?
- e) What charge would a chlorine ion have?
- f) Draw the Lewis symbol for a chlorine ion and check [here](#). (Note: if the charge is +1 or -1, the numeral "1" can be left out and can be written as + or -)

9) Consider the group 5A nonmetal, nitrogen (N).

- a) Predict how many valence electrons nitrogen will have. \_\_\_\_
- b) Verify your answer to part a by drawing a Bohr diagram. Check your diagram [here](#).
- c) What is the nearest noble gas (from question #3) to nitrogen?
- d) How will nitrogen complete its octet?
- e) What charge would a nitrogen ion have?
- f) Draw the Lewis symbol for a nitrogen ion and check [here](#).

10) Fill in the table. Click [here](#) to check your Lewis Symbols.

chem. symbol	metal or nonmetal?	group #	# of valence e <sup>-</sup>	# of e <sup>-</sup> (lost /gained)	charge of ion	Lewis symbol
Al	metal	3A	3	3, lost	+ 3	Al <sup>3+</sup>
I	nonmetal	7A	7	1, gained	-1	I <sup>-</sup>
Li						
Ba						
O						
P						

### Activity #3 – Naming Ionic Compounds

Open [\*Ionic Compounds Activity\*](#). An ionic compound consists of cations and anions.

- 1) Click the ion of lithium ( $\text{Li}^+$ ) and the ion of fluorine ( $\text{F}^-$ ).
  - a) What is the name of this compound?
  - b) Which ion comes first in the name, the cation or the anion?
  - c) What new ending does a group 7A ion get? (what replaces the *-ine* in *fluorine*?)
- 2) Consider an ionic compound of sodium and bromine.
  - a) What do you think the name of this compound will be?
  - b) What cation ion must you choose from the list?
  - c) What anion must you choose from the list?
  - d) Was your answer to part a correct? If not, what is the correct answer?
- 3) Some ions contain more than one element (polyatomic ions) and have special names. What is the name of the ion
  - a)  $\text{NH}_4^+$ ?
  - b)  $\text{SO}_4^{2-}$ ?
- 4) Transition (group B) metals can form ions with different charges. Let's investigate how the names of compounds containing these ions show the charge of the metal ion.
  - a) What is the name of the compound containing  $\text{Fe}^{2+}$  and  $\text{OH}^-$ ?
  - b) What is the name of the compound containing  $\text{Fe}^{3+}$  and  $\text{OH}^-$ ?
  - c) How does the name of the compound show which iron ion it contains?

- 5) Predict the names of the following compounds and then check your answers, correcting them if you were wrong.

ionic compound	cation	anion
	$\text{Pb}^{2+}$	$\text{SO}_4^{2-}$
	$\text{NH}_4^+$	$\text{S}^{2-}$
	$\text{Fe}^{3+}$	$\text{Cl}^-$

- 6) What ions compose the following compounds? Check your answers, correcting them if you were wrong.

ionic compound	cation	anion
iron (II) phosphate		
aluminum hydroxide		
barium fluoride		

#### **Activity #4– Formulas of Binary Ionic Compounds**

Read Predicting [\*Formulas of Ionic Compounds\*](#) and fill in the blanks.

#### **Problem**

Predict the formulas of the ionic compounds formed by the following elements:

- lithium and oxygen (Li and O)
- nickel and sulfur (Ni and S)
- bismuth and fluorine (Bi and F)
- magnesium and chlorine (Mg and Cl)

First, look at the locations of the elements on the \_\_\_\_\_. Atoms in the same column as each other (\_\_\_\_\_) tend to exhibit similar \_\_\_\_\_, including the number of \_\_\_\_\_ the elements would need to gain or lose to resemble the nearest \_\_\_\_\_ atom. To determine common ionic compounds formed by elements, keep the following in mind:

- Group I ions (alkali metals) have \_\_\_\_\_ charges.
- Group 2 ions (alkaline earth metals) have \_\_\_\_\_ charges.
- Group 6 ions (nonmetals) have \_\_\_\_\_ charges.
- Group 7 ions (halides) have \_\_\_\_\_ charges.
- There is no simple way to predict the charges of the transition metals. Look on a [table](#) listing charges (valences) for possible values. For introductory and general chemistry courses, the +1, +2, and +3 charges are most often used.

When you write the formula for an ionic compound, remember that the \_\_\_\_\_ ion is always listed first.

Write down the information you have for the usual charges of the atoms and \_\_\_\_\_ them to answer the problem.

		CHEMICAL FORMULA
1.	_____ $\text{Li}^+$ ions are required to balance _____ $\text{O}^{2-}$ ion	_____
2.	_____ $\text{Ni}^{2+}$ ion is required to balance _____ $\text{S}^{2-}$ ion	_____
3.	_____ $\text{Bi}^{3+}$ ion is required to balance _____ $\text{F}^-$ ions	_____
4.	_____ $\text{Mg}^{2+}$ ion is required to balance _____ $\text{Cl}^-$ ions	_____

Open the flash animation, [Binary Ionic Formulas](#).

1. Add one cation and one anion to each side of the balance.
2. Add another ion to whichever side is higher.
3. Continue adding one ion at a time to the higher side until the positive and negative charges balance.
4. Record your results in the table below.
5. Click "new compound" to get a new problem. Do 15 total.

(**Note:** The names of the compounds on this simulation use an older system that we will not be using.)

cation (+)			anion (-)			formula unit
Lewis Symbol	# used	total + charge	Lewis Symbol	# used	total - charge	

In each of the ionic compounds above, what is the sum of the total positive and negative charges? ) \_\_\_\_\_

Open [Nomenclature of Binary Ionic Compounds Containing a Metal Ion With a Fixed Charge](#). Read “Rules for Naming Binary Ionic Compounds Containing a Metal Ion With a Fixed Charge” and do the first 10 questions, recording your answers in the table below.

Note: you may not be filling in all columns for every question. Also note that everyone may not have the same questions!

	compound name	formula unit	#	cation	#	anion
1						
2						
3						
4						
5						
6						
7						
8						
9						
10						

Open [Binary Ionic Compounds Containing a Metal Ion With a Variable Charge](#). Read “Rules for Naming Binary Ionic Compounds Containing a Metal Ion With a Variable Charge” and do the first 10 questions, recording your answers in the table below.

	compound name	formula unit	#	cation	#	anion

### **Activity #5 – Polyatomic Ions**

Open the [Polyatomic Ion Game](#).

A **polyatomic ion** is a charged particle containing two or more covalently bonded atoms. This game will get you familiar with some of these ions. Build the given polyatomic ion by moving the element symbols into the boxes above. If you need more than one atom of that element, drag more to the same box. Do the same with the charge until you have the correct charge. There is a table of polyatomic ions in the back of the packet to help you. Race the person at the computer next to you. The first person to 30 points wins! Have your teacher initial below.

your score \_\_\_\_\_ teacher’s initials \_\_\_\_\_

After playing this game, would you say most polyatomic ions are negative or positive?

Open [Predicting Formulas of Compounds with Polyatomic Ions](#). Read and fill in the blanks below.

### **Problem**

Predict the formulas of these compounds, which contain polyatomic ions:

1. barium hydroxide
2. ammonium phosphate
3. potassium sulfate

When you write the formula for an ionic compound, remember that the \_\_\_\_\_ ion is always listed first. When there are two or more polyatomic ions in a formula, enclose the polyatomic ion in \_\_\_\_\_.

Write down the information you have for the charges of the component ions and balance them to answer the problem.

**CHEMICAL FORMULA**

1. \_\_\_\_\_  $\text{Ba}^{2+}$  ion is required to balance \_\_\_\_\_  $\text{OH}^-$  ions \_\_\_\_\_
2. \_\_\_\_\_  $\text{NH}_4^+$  ions are required to balance \_\_\_\_\_  $\text{PO}_4^{3-}$  ion \_\_\_\_\_
3. \_\_\_\_\_  $\text{K}^+$  ions are required to balance \_\_\_\_\_  $\text{SO}_4^{2-}$  ion \_\_\_\_\_

Open [Ionic Compounds Containing Polyatomic Ions](#). Read “Rules for Naming Ionic Compounds Containing Polyatomic Ions” and do the first 20 questions, recording your answers below.
